Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

best copy available

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general), aerodynamics, air transportation and safety, aircraft communications and navigation, aircraft design, testing and performance, aircraft instrumentation, aircraft propulsion and power, aircraft stability and control, and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 23/DECEMBER 8, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 3083

02 AERODYNAMICS 3084

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 3087

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 3088

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 3091

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 3093

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 3093

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 3095

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 3095

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 3096

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS N.A.

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 3097

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 3097

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 3098

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING N.A.

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 3099

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 3099

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 3099

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power*, *28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 3100

Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 3100

Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 3102

Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 3107

Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 3111

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 3114

Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power*, *20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics*.

31 ENGINEERING (GENERAL) 3121

Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 3124

Includes land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 3130

Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 3135

Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 3137

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 3139

Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 3140

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 3143

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 3144

Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) 3151

43 EARTH RESOURCES 3151

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 3156

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 3172

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 3180

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 3183

Includes weather forecasting and modification.

48 OCEANOGRAPHY 3187

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 3188

Includes genetics.

52 AEROSPACE MEDICINE 3188

Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 3189

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 3190

Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.

Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 3192

Includes computer graphics and data processing.

For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 3192

Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 3194

Includes computer networks.

63 CYBERNETICS 3194

Includes feedback and control theory.

For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 3194

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 3198

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 3200

Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 3200

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

For related information see also *Engineering*.

70 PHYSICS (GENERAL) 3200

For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 3201
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 3203
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 3204
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 3206
Includes light phenomena.

75 PLASMA PHYSICS 3207
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 3212
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 3216
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 3217
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 3217
Includes information storage and retrieval technology, micrography, and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS N.A.
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE 3219
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 3220
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 3220
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 3221
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 3221
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 3222
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 3222
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

NASA ACCESSION NUMBER → N80-10195*# Teledyne Ryan Aeronautical Co., San Diego, Calif ← CORPORATE SOURCE

TITLE → STUDY OF THE FEASIBILITY ASPECTS OF FLIGHT TESTING AN AEROELASTICALLY TAILORED FORWARD SWEPT RESEARCH WING ON A BQM-34F DRONE VEHICLE

PUBLICATION DATE

AUTHOR → D. J. Mourey 3 Sep 1979 409 p refs

(Contract NAS1-15624)

AVAILABILITY SOURCE

CONTRACT OR GRANT → (NASA-CR-159149) Avail: NTIS HC A18/MF A01

CSCL 01C ← COSATI CODE

REPORT NUMBER → The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0007, SYSTEM 2000 AIRCRAFT/STORE INTERFACE DATA SYSTEM
J. Terranova, U.S. Dept. of Defense, Air Force, Armament Lab., *Eglin Air Force Base, Florida* 32542 (DF645320)

Air Force function - compatibility analyses and configuration control of aircraft and weapon interfaces. Deficiency - the aircraft/store interface data system (ASIDS), which was developed as a tool to assist in the above function, requires conversion to the System 2000 procedural language interface to simplify user access and system output. Objective - produce System 2000 PLI analysis software for the ASIDS to make the ASIDS capabilities available as a System 2000 resource. How work contributes - this effort will provide the DOD aircraft and store communities with a multi-user, accessible and centrally controlled aircraft/store electrical interface analysis capability.

The ADTC Math Laboratory will be tasked to convert the existing ASIDS electrical interface analysis software into System 2000's PLI software. Complete documentation in accordance with established military standards will be a product of this effort.

1.0016, LAMARS MOTION MODIFICATION STUDY
L.R. Maki, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144190)

This effort supports engineering simulation research and development conducted in the Flight Control Development Laboratory. The AFFDL large amplitude multimode aerospace research simulator (LAMARS) has recently been found to have motion deficiencies which appear to be primarily software-oriented. The objective is to substantially reduce, if not eliminate, these deficiencies by analyzing and modifying the present motion system software. The quality of the motion cues has a direct bearing on the effectiveness of LAMARS simulations.

A thorough review and analysis of the LAMARS motion system software will be conducted. Available data on washout effects and adjustments will be compiled and assessed. Washout analysis will be performed on the CDC computer system. An analysis of the LAMARS system hardware will also be conducted as a performance check. Following demonstration and evaluation of the modified system, a manned simulation evaluation will be performed. Availability of the LAMARS system will affect the completion dates of certain portions of the project requiring its use.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0017, VISUAL SYSTEM MICROPROCESSOR DRIVE IMPLEMENTATION
J. Pollard, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143790)

This effort is in support of the engineering R&D simulation mission of the engineering flight simulation facility (AFFDL/FGD). It addresses the method of controlling and driving the terrain model visual system resident at the facility. The objective is to design and implement a microprocessor-based system for controlling and driving this system, with both hardware and software development anticipated. Fruition will result in the 'freeing' of a valuable general purpose computer for other applications, and help to establish in-house expertise in this area.

The approach involves a cooperative effort between AFFDL/FGD and USAFA/DFEE over approximately a one-year period. Most hardware and system software aspects will be handled by DFEE, while visual-related software will be handled primarily by FGD. Cross-involvement is of course expected and is to be encouraged for training reasons. A project schedule is currently under mutual formulation and review. The scheduling indicates parallel development of hardware and software portions with mutual feedback influencing later portions.

2.0001, EFFECTS OF PAYLOAD HANDLING CONSIDERATIONS ON SPACE SHUTTLE TRAJECTORIES DURING PROXIMITY OPERATIONS
W.T. Fowler, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Mechanics, *200 W. 21st, Austin, Texas* 78712

Research is being conducted into the proximity operations, or rendez-vous, phase of space shuttle missions involving payload recovery. One- and two-impulse trajectories from station-keeping locations within 1000 feet of the target body payload are being considered. A one-impulse trajectory is defined to have a final relative velocity less than or equal to 0.2 ft./sec. This value is the maximum allowable rate (at maximum payload mass of 3200 lbs.) for RMS capture. All successful rendez-vous

trajectories must meet rigid constraints on plume impingement, crew visibility, total fuel consumption, total coast time (time from first impulse to final approach), and safety. This continuing project is in its second year.

2.0002, NONLINEAR ESTIMATION THEORY
B.D. Tapley, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Mechanics, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: By the application of the Martingale Theory and smoothing properties to the study of nonlinear stochastic dynamic systems, an approximate nonlinear estimation algorithm has been developed. In order to determine its effectiveness, the nonlinear estimation algorithm as well as the extended Kalman filter are applied to the problem of estimating the trajectory of a planetary spacecraft using range, range-rate, sun-planet and star-planet angle measurements. The result of the computer-simulated study shows that the nonlinear algorithm is superior to the extended Kalman filter when the measurements are highly nonlinear. A comparison of the algorithm with other nonlinear estimation algorithms is being made also. This line of research is expected to extend for several years.

3.0003, LIQUID LITHIUM CORROSION AND CORROSION FATIGUE RESEARCH
Unknown, Colorado School of Mines, Graduate School, *Golden, Colorado* 80401 (EY-76-S-02-2313)

Liquid lithium corrosion kinetics (weight loss and intergranular penetration) of ferrous alloys are being established as a function of impurity content, temperature and stress. Materials being investigated are iron, iron-chromium and iron-chromium-nickel alloys, such as 2 1/4 Cr - 1 Mo steel and type 304 stainless steel. Deformation-enhanced corrosion is being studied by various modes of loading, including torsional fatigue techniques which allow large amounts of strain without specimen instability. Spindle techniques are also being applied to determine the influence of the fluid velocity of the liquid lithium. Mossbauer spectroscopy, Auger secondary electron spectroscopy and electron microscopy are being applied to better understand the nature of the lithium-penetrated grain boundaries.

RESULTS: Mathematical expressions for grain boundary penetration and weight loss rate coefficients, as functions of the nitrogen content and temperature, were established for 304L stainless steel in liquid lithium. The environmental conditions where each mode of attack is dominant are being determined. Deformation-enhanced corrosion behavior has been reported. An MTS mechanical testing system has been installed in a protective atmosphere box to determine the role of deformation of the corrosion processes.

3.0004, RESEARCH ON DEFORMATION PROCESSES IN REFRACTORY METALS
Unknown, State University System of Florida, University of Florida, Graduate School, *Gainesville, Florida* 32601 (EY-76-S-05-3262)

The mechanical properties of metals and alloys can be strongly influenced by phenomena other than simple slip. Among these perturbing phenomena are dynamic strain-aging, mechanical twinning, and dynamic recovery. The nature of these, and the magnitude of their effects on the stress-strain behavior of the metals titanium, niobium, vanadium and tantalum containing interstitial impurities, are being determined. Emphasis is now being placed on an attempt to find interrelations between dynamic strain-aging and slow strain-rate embrittlement. In transition metals, both types of phenomena can be caused by interstitial elements such as hydrogen, oxygen, nitrogen and carbon when the latter is in solid solution. Specific attention is being paid to the niobium-oxygen-hydrogen, niobium-oxygen and vanadium-hydrogen systems. Tensile tests will be carried out to fracture on specimens of high purity niobium and vanadium alloyed with the appropriate interstitials between 4 and 1100 K at several strain rates. Internal friction, fractographic ductility and stress-strain data from these tests will be correlated and analyzed. These tests will be complimented by static strain-aging tests in which the specimens are aged under stress.

RESULTS: During the past year, as part of this project, the diffusion coefficients of oxygen and nitrogen were remeasured in the three type Va metals. Improved torsion pendulum and elastic after-effect techniques were employed. In these procedures the data were analyzed with the aid of a non-linear least squares computer optimization program. These new data, when combined with existing high temperature data in the literature, favor the assumption that O and N occupy octahedral sites in the type Va bcc lattice.

3.0005, STUDIES OF POINT DEFECTS ON MECHANICAL PROPERTIES OF METALS INCLUDING ELECTRON IRRADIATION STRENGTHENING OF ALL SINGLE CRYSTALS
M. Meshii, Northwestern University, Evanston Campus, Technological Inst., Dept. of Materials Science & Engineering, *633 Clark St., Evanston, Illinois* 60201 (EY-76-S-02-1367)

The effect of point defects on the mechanical behavior of b.c.c. metallic single crystals is being investigated. The point defects under investigation are interstitial atoms produced by electron irradiation (1 to approximately 2 MeV) and interstitial solutes introduced by diffusion annealing. This study will characterize the electron irradiation effects on the mechanical properties of metals and alloys and, at the same time, will enhance the understanding of strength and its dependence on experimental parameters such as temperature, strain rate, and structure of specimen materials in terms of the atomic mechanisms involved. The current emphasis is on the comparison of iron and niobium single crystals in the irradiation effect and the surface film effect.

SUPPORTED BY U.S. Dept. of Energy, Office of Energy Research

3.0006, USE OF VERY HIGH PRESSURE TO INVESTIGATE THE STRUCTURE OF MATTER
H.G. Drickamer, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Chemical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (EY-76-C-02-1198)

The basic thesis of our research is that high pressure is an essential tool for understanding electronic phenomena in condensed systems. With increasing compression there is increased overlap among electronic orbitals. Different types of orbitals are

perturbed to different degrees. A study of these perturbations permits one to characterize electronic states and excitations, to test theories, and, under some circumstances, to induce electronic transitions to new ground states.

Our current research centers around luminescence measurements. We can measure energies and peak shapes over a range from 240 to 1200 nm, lifetimes to as fast as one nanosecond, and efficiencies as low as 10 to the minus 5th power to 10 to the minus 6th power. With these techniques we study the behavior of a variety of organic and inorganic solutes in crystalline, liquid and amorphous (polymers and glasses) media.

The types of phenomena with which we are concerned include energy transfer, Jahn-Teller splitting of excited states, phonon-assisted transitions, radiationless transition rates, intersystem crossing, the mixing of n-pi and pi-pi excitations, and the structure of the excited state in complexes.

3.0008, MICROCHEMISTRY OF SOLIDS

C.A. Wert, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Metallurgy & Mining Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (EY-76-C-02-1198)

Many second-phase compounds in solids are extremely fine particles and are widely dispersed through the solids. Alloying elements which strengthen materials--commonly carbides, oxides, or nitrides--oftentimes are dispersed in particles of size 50 to a few hundred Angstroms. Determination of crystal structure and chemical compound of these dispersions is being made using quantitative analytical electron microscopy. Using these techniques, we have determined the crystal structure and stoichiometry of carbides in a mixed vanadium-titanium-carbon alloy. Three carbides exist in three aging regions, one just above room temperature, one at about 600 degrees C and one at temperatures over 1000 degrees C. These carbides can be completely characterized down to particle sizes around 300 to 500 A. This work is being transferred to another project and some new work related to microchemistry of inclusions in coal is being investigated. The structure and composition of iron sulfides in a coal char derived from a liquefaction process are being examined. Using transmission electron microscopy, we are beginning to examine the mineral constituents in coal itself.

3.0012, NUCLEAR MAGNETIC RESONANCE STUDIES OF POLYPHOSPHAZENE POLYMERS AND METALLIC ALLOYS

P. Sagalyn, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0G4726)

(1) To determine the microstructure(s) and thermal properties of polymers having phosphorous-nitrogen backbones, and to correlate them with bulk properties to help produce improved polyphosphazenes. (2) By using the electric field gradient to determine the changes which occur in the immediate vicinity of point defects in metals, to improve the characterization of radiation damage, damage due to ion implantation, and solvent-solute interactions. To characterize beryllium metal and alloys via NMR for quality assurance and for gaining understanding that will lead to improved materials for missiles, aircraft and composites.

(1) NMR spin-lattice relaxation times and line parameters will be measured as functions of temperature to characterize the motions of l-side chains and backbone in poly(bis(trifluoroethoxy)phosphazene). If time permits, other poly(alkoxy-phosphazenes) will be examined. (2) Extensions of our theory of EFGS due to point defects in metals will be applied, as time permits, to dilute alloys of and vacancies in aluminum. Manuscripts on Be and BeNi, currently in first draft form, will be completed.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0013, THE RADIATION CHEMISTRY OF LIQUID AND PLASTIC CRYSTALS

Unknown, University of Mississippi, University Campus, Graduate School, *126 Biology Bldg., University, Mississippi* 38677 (EY-76-S-05-3781)

The purpose of this investigation is the understanding of the radiation chemistry of compounds in the nematic liquid crystal state and of compounds in the plastic crystal state. From the understanding of the radiation chemistry in these mesomorphic states, it is the intention of this study to develop a model or models to explain the effects of radiation. Due to the liquid-like nature of these mesomorphic states, the initial effort is directed to a modified diffusional model.

In addition to the standard radiation chemical approach to this problem, several other approaches are being made. One of these involves determination of the rotational energy barriers from polarized optical transmission spectra. The second involves determination of the diffusional barriers from nmr T1 (rho) measurments. The third approach involves determination of the initial G-values and nature of the species initiating the reactions from positron probe lifetime studies.

3.0015, DEFECTS OF METAL CRYSTALS
R.W. Balluffi, Cornell University, Ithaca Campus, School of Engineering, Dept. of Materials Science & Engineering, *242 Carpenter Hall, Ithaca, New York* 14853 (EY-76-S-02-3158)

The objective of the present research effort is a broad investigation of the properties of crystal defects in metal crystals. Attention during the past year was focused on point-defects (vacancies, self-interstitial atoms (both substitutional and interstitial) and aggregates of point-defects. A strong emphasis was placed on the use of different irradiating species (300-700 eV Xe positive ions, 100 to 1500 eV He positive ions, 250 to 2000 eV Ne positive ions, 30 keV W positive Mo positive or Cr positive ions, and fast neutrons) to introduce both vacancies interstitials (self and impurity) in a number of different pure metals (Mo, Au, W) and alloys (W(Re)), Mo (Ti), Mo (Ti plus Zr), Ni4Mo, Pt3CO, Ni3Fe and Ni3Mn). Progress was made in the following areas: (A) The Direct Observation of the Point-Defect Structure of Depleted Zones in Ion-Irradiated Metals; (B) The Spatial Distribution of Self-Interstitial Atoms Within and Around Depleted Zones; (C) An FIM Study of Stage I Recovery of Ion-Irradiated Molybdenum; (D) The Transmission Sputtering of Gold Thin Films by Low Energy (less than 1 keV) Xenon Ions; (E) Atom-Probe Field-Ion Microscope Studies; (F) The Range of Focused Collision Replacement Sequences in Ordered Alloys and the Random Disordering of Ordered Alloys; (G) The Recovery Behavior in Stages I, II and III of Proton-Irradiated Tungsten; and (H) the Fast-Neutron Irradiation of Wire Specimens in EBR-II.

3.0018, STUDY OF THE IONIZING RADIATION-INDUCED REACTIONS IN ORGANIC COMPOUNDS
Unknown, Ohio State University Research Foundation, *1314 Kinnear Rd., Columbus, Ohio* 43212 (EY-76-S-02-1116)

Determination of enhancement of Ar excimer and Ar (ls) atom yields by admixture of Ne and Ar, measurement of rate constants for growth and decay of Ar excimers and Ar/Ne mixed excimers, measurement of rate constants for quenching of Ar (ls) atoms and transient and metastable Ar excimers by N2 and elucidation of mechanisms for decay of Ne (ls) atoms in pure Ne gas - by fast spectrophotometric monitoring of absorbing species following passage of brief, high current, high kinetic energy electron beam pulses through samples of rare gases and mixtures containing rare gases.

RESULTS: Ar (ls) atoms in pure Ar decay entirely via formation of Ar excimers at 100 to 700 torr, 153K to 300K. Resonance state Ar (ls) atoms as well as metastable state Ar (ls) atoms decay through first excited singlet excimer state - the latter by means of inverse predissociation from the first metastable state of the excimer. Temperature coefficients of Ar (ls) decay constants are small, positive and attributable to effects of temperature on collision frequencies of elementary steps.

3.0019, STRUCTURE OF GLASSES CONTAINING TRANSITION METAL IONS
W.B. White, Pennsylvania State University, University Park Campus, Materials Research Lab., *Research Center, Room 212, University Park, Pennsylvania* 16802 (EY-76-S-02-2754)

This research concerns the structure and behavior of insulator glasses with respect to the transition metals as additives. The research strategy is to prepare silicate, borate, and other host glasses, and to study the local structure, interaction with glass structure influence on nucleation and crystallization and phase separation of a selected set of transition metal ions. Experimental approaches include structure of glass by Raman spectroscopy, local structure around transition metal ions by optical absorption and luminescence spectroscopy, experiments on the controlled reduction of the transition metals to investigate the effect of oxygen activity in the glass and the way in which the transition ions are bound to the glass structure. Completed investigations include structure of nitrate glasses, structure of lead silicate glasses, identification of molecular chromate and dichromate groups in silicate and borate glasses, optical and luminescence spectroscopy of Cr3 ions in silicate glass, construction of several theoretical models for molecular relaxation and electron-phonon interactions, and the role of iron and titanium in silicate glasses.

3.0021, ANGULAR MOMENTUM EFFECTS IN NUCLEAR REACTIONS
Unknown, Texas A & M University, College Station Campus, Cyclotron Inst., Dept. of Chemistry, *College Station, Texas* 77843 (EY-76-S-05-3924)

Research supported by ERDA contract E(40-1)-3924 will be continued. Counter telescopes will be used to measure the yields, energy distributions and angular distributions of elements produced in the reactions induced by heavy ions of energies less than or equal to 100 MeV/amu. Mechanisms of interaction will be deduced. Theoretical models of reaction mechanisms, potential energy surfaces and nuclear properties under conditions of high angular momentum will be tested. Projectiles of 12C, 14N, 16O, 20Ne and 40Ar will be employed. In a collaboration involving LASL, LBL, BNL, ORNL and TAMU, attempts will be made to make direct on-line mass measurements of neutron-rich nuclei produced in the reactions of 800 MeV protons with uranium.

RESULTS: Cross-sections, energy distributions and angular distributions for the deep-inelastic and fusion reactions of 197 MeV 12C with Ni, Y, Ag, Tb and Au targets have been meas-

ured. The gamma-ray multiplicities of products of the reactions of 120 MeV 20Ne with 27Al have been measured. Five new neutron-rich isotopes, 27Ne, 31Mg, 32Mg, 34Al and 39P have been discovered.

3.0022, IMPURITY EFFECTS ON THE CREEP OF POLYCRYSTALLINE MAGNESIUM AND ALUMINUM OXIDES AT ELEVATED TEMPERATURES

R.S. Gordon, Utah Higher Education System, University of Utah, School of Engineering, Dept. of Materials Science & Engineering, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (EY-76-S-02-1591)

Steady-state creep studies (constant load and stress relaxation) under four-point bending and tensile conditions will be conducted at temperatures between 1100 and 1600 degrees C on dense polycrystalline MgO and Al2O3 specimens which have been doped with transition metal impurities (e.g., Fe, Cr, Mg, Mn, Ti). Tests will be conducted over a range of stresses (up to 20,000 psi) and oxygen partial pressures (1-10 atm). Test specimens are fabricated by vacuum hot pressing at 1500-1700 degrees C. After fabrication and before creep, testing specimens are annealed at 1450-1900 degrees C. to stabilize the grain size and/or to insure a uniform impurity distribution.

The overall objective of these studies is to understand the role of impurities in governing the relative roles of the diffusional, unaccomodated grain boundary sliding, and dislocation mechanisms to the high temperature creep of polycrystalline MgO and Al2O3. Secondly, the role of lattice defects which are created by solid solution impurities in diffusional creep processes will be evaluated. Impurities and experimental variables such as temperature, oxygen partial pressure, and grain size which contribute to increased high-temperature creep resistance are of major interest.

RESULTS: The creep of hot-pressed, high purity polycrystalline magnesium oxide takes place both by non-viscous (dislocation) and diffusional modes depending on the stress and grain size. Diffusional creep has been identified in high purity, fine-grained MgO by evaluating transient creep data in terms of simultaneous grain growth. Doping with iron in amounts up to about 5 cation percent has several effects on the high-temperature creep behavior. 1. Diffusional contributions to the creep rate are enhanced and are dominant for small grain sizes and stresses. 2. Increasing amounts of trivalent iron in solid solution lead to increased rates of viscous creep due to cation vacancy information but they have little or no effect on non-viscous or dislocation mechanisms of creep, which are dominant at high stresses in coarse-grained material. Iron in solid solution makes the diffusional creep rate sensitive to the oxygen partial pressure. Creep rates in oxidizing atmospheres are faster than those in reducing environments. (Text Abridged)

3.0023, X-RAY STUDIES OF THE BEHAVIOR OF TITANIUM AND MOLYBDENUM FILMS ON SILICON SUBSTRATES

C.R. Houska, Virginia Polytechnic Inst. & State University, School of Engineering, Dept. of Materials Engineering, *Blacksburg, Virginia* 24061 (DMR77-26824)

This research will be a study of high-temperature reaction kinetics between thin films of titanium or molybdenum and silicon single crystal substrates. Reaction of such films with silicon to form metal silicides is used to form ohmic contacts and barriers on silicon semiconductor devices.

The major experimental tool to be used in these studies will be X-ray diffraction with supporting scanning electron microscopy. X-ray data will be collected at elevated temperatures to determine the identity, thickness, and orientation factors for each phase formed during the reaction. Computer simulations will be used to fit diffusion profiles. The X-ray line shape data will be analyzed to obtain uniform and non-uniform strain in the film and reaction layers, as well as to obtain subgrain size.

This is a renewal of NSF Grant DMR75-17201.

4.0004, MIST-FLOW OCEAN THERMAL ENERGY PROCESS

S.L. Ridgway, R & D Associates, *4640 Admiralty Way, P.O. Box 9695, Marina Del Rey, California* 90291 (W-7405-ENG-26-SUB 7613)

The objective of this project is to determine the feasibility of the mist lift ocean thermal energy process. Essential components of the system are to be developed and tested. The fluid dynamics of the two-phase flow that takes place in the lift tube should be understood in sufficient depth and detail to enable reasonable projections of the operating characteristics and boundaries of the possible capital costs of a mist flow ocean thermal energy plant. The influence of mist parameters (droplet size, droplet size distribution) and transport parameters (pressure gradient, duct profile, and velocity schedule) on the lift effectiveness of the two-phase flow is to be determined.

A thermodynamic analysis of the mist flow process is complete. The two-phase flow analyses were based on the assumption of constant lift effectiveness and preliminary choices of possible duct area profiles, injection velocity, and flow velocity schedule. The results of this analysis were used for the technical and cost assessments. Analyses of experimental results will be followed so that a baseline mist lift efficiency can be established. Previous systems analysis showed that a low lift efficiency would not raise capital costs excessively.

4.0008, BASIC MECHANISMS INFLUENCING SOLAR CELL EFFICIENCY FOR TERRESTRIAL APPLICATIONS
F.A. Lindholm, State University System of Florida, University of Florida, School of Engineering, Dept. of Electrical Engineering, *220 Black Hall, Gainesville, Florida* 32611 (EY-76-S-05-5134)

The objectives of this research are: (1) to determine and describe the basic mechanisms that control and limit solar-cell conversion efficiency; (2) to develop mathematical models that enable the inclusion of these mechanisms in the engineering design of solar cells; and (3) to explore design improvements based on the understanding gained of the basic mechanisms. By basic mechanisms are meant the mechanisms that determine the transport, recombination, and generation of electrons and holes in semiconductor material and, thereby, in large measure, determine the solar conversion efficiency. Thus the research focusses on the mechanisms that control the electronic parameters, such as lifetime and effective band gap, that characterize the transport, recombination and generation processes. It focusses also on the basic mechanisms by which such design variables as injection level, doping profile, and device structure influence these processes.

5.0005, RESEARCH IN RADAR APPLICATIONS
H. Masursky, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02347)

Side-looking radar images will be acquired from orbital and aircraft altitudes, using radar systems similar to those planned for future planetary missions. SEASAT images will be obtained at L-band frequency; look angle will be approximately 50 degrees. Same-side and opposite-side stereo radar images will be obtained by commercial simultaneous L-band and X-band radar systems. Interpretive geologic maps will be compiled from these

images of three areas. Geologic maps will also be compiled of the three areas from visible and IR wavelength images. Specific areas where the radar-generated map differs from the visible/IR map will be checked in the field. Conventional geologic mapping has already been completed in the areas chosen for this study; geologists responsible for the completed geologic mapping will be consulted when the field check is conducted.

Three test areas were chosen where diverse geologic units are thought to be analogous to those that will be imaged by future planetary missions, and where the most time and cost-effective studies can be conducted. Silt and sand dune patterns will be imaged and compared in the Cortez and Algadones areas. Basaltic and rhyolitic extrusive volcanic rocks, intrusive igneous rocks, and sedimentary formations will also be contrasted in the Cortez area. Lava flows, sedimentary rocks, dune fields and river channel deposits will be compared in the San Francisco volcanic field.

5.0007, RADAR IMAGE PROCESSING RESEARCH

L.A. Soderblom, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Astrogeologic Studies, *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02350)

STATE TO WHICH PROJECT PERTAINS: Arizona.

Several types of radar images of a collection of geologic targets have been or will be acquired for input to digital image processing. The radar data that have been collected include two frequencies and two different polarizations; different resolutions, azimuths and depression angles for the same frequencies and polarization. From both aircraft and SEASAT data the objectives are to investigate the following areas: 1. geometric corrections to include point perspective projections; 2. clean-up of the digital data (i.e., noise removal techniques which include bit errors, drop-lines, speckle and coherent patterns); 3. digital registration for the radar images of differing frequencies, polarizations and look directions; 4. topography enhancement; 5. radar albedo enhancement; 6. digital mosaicking of several image strips; 7. elimination of the radar shadow by using two different look directions; and 8. development of digital filters which will minimize the 'ringing' effects from high contrast images.

L.A. Soderblom, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Astrogeologic Studies, *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02238)

Provides scientific guidance and leadership in the design and fabrication of the NIMS instrument, in the design of the mission orbital sequences, and in planning ground-based data reduction and science analysis. This activity will be ongoing through 1985.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0009, FRAUNHOFER LUMINESCENCE

R.D. Watson, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, EROS Data Center, *2255 N. Gemini Dr., Flagstaff, Arizona* 86001

STATES TO WHICH PROJECT PERTAINS: Western United States, Oklahoma, Maine, and Florida.

Laboratory measurements of the luminescence of selected gases present in natural seeps are planned to both quantify their luminescence properties and to determine their detectivity with the imaging FLD. Tank tests, using the imaging FLD suspended over the tank, will be conducted to correlate physical properties of oil (specific gravity, film thickness, weathering, etc.) and gas seeps with their luminescence properties. Luminescence images of selected sites of oil and gas seeps, as well as vegetated areas under hydrocarbon stress, will be acquired in cooperation with other federal agencies and the GEOSAT Committee.

Analysis of imagery acquired over areas of geochemically stressed vegetation, luminescent playas and uranium sandstones will proceed and will incorporate further refinements in image analysis techniques.

Additional sampling of materials in areas where FLD imagery was acquired is planned for atomic absorption and chemical analysis. Results of this analysis will permit a more accurate determination of the cause of luminescence anomalies.

A proposal to incorporate an imaging FLD in a shuttle experiment for acquiring luminescence images of selected areas on the Earth's surface from orbit altitudes will be submitted to the National Aeronautical and Space Administration (NASA).

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office

5.0010, GROUND-WATER HYDROLOGY OF THE COCONINO AQUIFER IN SOUTHERN APACHE COUNTY, ARIZONA - A MATHEMATICAL ANALYSIS

P.P. Ross, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Flagstaff, Arizona* (AZ 78-046)

Coconino aquifer will be the source of water for large ground-water withdrawals in the near future. Coronado generating plant and possible construction of a second generating plant will require additional water. Also, more water will be needed to support construction and maintenance personnel and satellite industries. Pumpage may increase by 50,000 AF within the next few years. Effects of the project pumpage are unknown because the ground-water flow system is poorly defined in part of the area.

The principal objectives are (1) to provide a preliminary estimate of the average recharge and discharge values and to difine the aquifer characteristics of that part of the Coconino aqifer that is within southern Apache County, and (2) to determine the potential effects of the projected ground-water withdrawals.

Potentiometric surface, aquifer thickness, water-level decline and aquifer characteristic data at selected points are available. Additional data required include estimates of recharge and discharge. Recharge will be estimated by a flow net analysis and discharge will be estimated on the basis of available spring-flow, stream-flow and pumpage measurements. The model will be calibrated using steady-state and transient-state techniques. When the model is calibrated the project pumpage values will be used to simulate water-level declines for the years 1985 and 2000.

The steady-state model was calibrated. The model seems to be sensitive to changes in transmissivity, which reflect the geologic structure of the area. Part of the report was written.

The transient-state model will be run to verify the steady-state calibration.

R.M. Reynolds, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., *Boulder, Colorado* 80302 (R7120848)

OBJECTIVE: As part of the OCSEAP effort, obtain a descriptive picture of the extent, magnitude, frequency and distribution of near-shore meteorological processes which contribute to the circulation and mixing of coastal waters.

CURRENT YEAR PLAN: An existing mesoscale model will be applied to each of three study areas with the resulting wind field to be analyzed in terms of forcing functions being modelled. Operational data will be collected from both synoptic scale and mesoscale instruments to obtain data in near-shore regions for verification of model output and for providing understanding of off-shore and along-shore wind variations.

PROGRESS REPORT: Wind data from several sources in the Yakutat area were collected. Several aircraft flights were made to provide large-scale near-synoptic coverage of the study area. Data indicate winds near the coast are more directional than those off-shore. The effect of the coastal range on turning coastal flow is evident.

SUPPORTED BY U.S. Dept. of the Interior, Bureau of Land Management

5.0025, GRAVITY WAVE STUDIES
J.W. Wright, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., *Boulder, Colorado* 80302 (RDJ44833)

Conduct a program of theoretical and experimental studies concerned with the effects of atmosperic gravity waves on the ionosphere and, in turn, with their effects on methods of observing the ionosphere.

SUPPORTED BY University of California

5.0026, LANDSAT AND AIRCRAFT IMAGERY FOR MINE-GROUND STABILITY EVALUATION
R.K. Rinkenberger, U.S. Dept. of Labor, Mine Safety & Health Admin., *P.O. Box 25367, Denver, Colorado* 80225

STATES TO WHICH PROJECT PERTAINS: Colorado, Utah, Wyoming, New Mexico, Kentucky, New York.

A suite of computer enhancement routines will be performed on five LANDSAT CCT's using the EROS Data Center GE-100 System. The tapes represent underground coal, limestone and salt mine sites and surface coal pits in New York, Kentucky, New Mexico, Wyoming, Utah, and Colorado. The sites have been extensively evaluated by the Mine Safety and Health Administration (MSHA) using conventional methods of imagery analysis. Initial observations using computer-aided imagery analysis, i.e., enhancement routines such as linear stretch, non-linear stretch (PFD) principle components, overview, and rationing, show promise for extending the interpretation capabilities related to mine-ground stability evaluations. The major output products from the exercise will be 35 mm slides of 90 separate images including annotated overviews, subscenes, ratios, lineaments, principal components, and composites.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office

5.0027, TREE-RING ANALYSIS OF RECENT SLIDE MOVEMENT, MANTI LANDSLIDE, UTAH
S.S. Agard, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Engineering Geology, *Box 25046, Denver Fed. Ctr. Bldg. 25, Denver, Colorado* 80225 (9550-02400)

STATE TO WHICH PROJECT PERTAINS: Utah.

The major objective of this project is to test and further develop the techniques of tree-ring analysis as applied to recent mass movements through a detailed study of the Manti landslide. This includes evaluating the effects of the most recent movement (1974 to present) of the Manti landslide on tree growth, investigating the history and nature of movement prior to 1974 using tree rings, climate records, and air-photos, and examining the relationship between climate and slide movements. Efforts in the current year will include: 1. collection of additional cores and sections from within and adjacent to the Manti landslide; 2. preliminary analysis of tree cores collected during FY 78; 3. investigation of alternative numerical, graphical, and statistical analysis techniques; 4. compilation of climate records and other supportive data; and 5. preparation of preliminary reports.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0028, REMOTE MONITORING OF SOURCE PARAMETERS FOR SEISMIC PRECURSORS
G.L. Choy, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Global Seismology, *Box 25046, Denver Fed. Ctr. Bldg. 25, Denver, Colorado* 80225 (9920-02383)

To search for and to accumulate statistics about spatial and temporal changes of waveforms and source parameters that can be associated with an imminent major earthquake.

To evaluate the effectiveness of a standardized and digitally recorded global network of seismographs as a remote monitor for these spatial and temporal changes.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0029, MOLE LAKE
B.D. Smith, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *Box 25046, Denver Fed. Ctr. Bldg. 25, Denver, Colorado* 80225 (9780-02186)

STATE TO WHICH PROJECT PERTAINS: Wisconsin.

Ground geophysical surveys will be conducted to follow up the completed airborne geophysical survey to characterize potential areas of massive sulfide mineralization on Indian lands. New EM methods will be evaluated to determine their applicability to massive sulfide mineralization exploration. Computer contour maps of the airborne data will be constructed for use in both metallic and non-metallic mineral evaluations. IP complex resistivity surveys will be used where needed to help differentiate metallic from non-metallic conductors (e.g., sulfides versus graphites). Bore hole geophysical surveys will be used to help establish the nature of the electrical properties of the felsic volcanic units that are the host rocks for massive sulfide mineralization.

5.0033, RESOURCE EVALUATION OF THORIUM AND ASSOCIATED HEAVY MINERAL-BEARING SAND OF THE COASTAL AREA OF GEORGIA

K. McConnell, State Geological Survey, *19 Martin Luther King Dr. S.W., Room 400, Atlanta, Georgia* 30334 (14-08-0001-G-491)

STATE TO WHICH PROJECT PERTAINS: Georgia.

Recently the Coastal Plains Commission has made an aeroradiometric map that includes the coastal area of Georgia. This project is to explore radiometric highs over beach sands for possible heavy mineral deposits. Work will be carried out by drilling holes in six areas. Heavy minerals will be separated and those samples containing more than two percent heavy minerals will be further processed for their thorium and titanium content.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0034, HAWAIIAN VOLCANISM AND ITS PLANETARY IMPLICATIONS

D.W. Peterson, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Hawaiian Volcano Observatory, *Hawaii National Park, Hawaii* 96718 (9720-02162)

STATE TO WHICH PROJECT PERTAINS: Hawaii.

The planetary geology program at the Hawaiian Volcano Observatory strives to promote scientific interaction between observatory staff and researchers interested in planetary volcanism. This is accomplished through topical studies by Observatory staff and visiting planetary geologists. Plans for FY1979 include compilation of two or more comprehensive photo-atlases of Hawaiian landforms and surface features.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0035, RADAR

K.H. Shreeve, U.S. Dept. of Commerce, Equipment Development Lab., *Silver Spring, Maryland* 20910 (8AA830)

TECHNICAL OBJECTIVE: Cooperative effort to study new techniques and equipment to improve the NWS weather radar facility and its usefulness. EDL, in cooperation with the National Severe Storms Laboratory (NSSL), Norman, Oklahoma, SDO's Technique Development Laboratory (TDL), OTS, OM&O, and others, will work to improve hydrologic and meteorologic output products, communications, and to establish new equipment and technique requirements and specifications.

APPROACH: 1. Continue the joint experimental program with NSSL, OTS, and OM&O to establish an operational Doppler radar configuration and field techniques. 2. Experiment with the Signal Variability Processor (SVP) to establish the best use of pulse-to-pulse difference techniques. 3. Study state-of-the-art techniques in radar, display and communications in preparation for the procurement and operation of a next generation radar prototype facility.

PROGRESS: Signal processing, data processing, and display techniques for both conventional and Doppler radar are under investigation for possible application to new radar systems. An experimental color display system was developed for use on the National Severe Storms Laboratory's (NSSL) Doppler radar. Doppler radar's use for velocity measurements is key to providing advanced severe weather warnings, in particular for tornadoes and damaging wind situations. The Radar Data Processor (RADAP) equipment's functional design and specification was completed, and it is now in the procurement cycle. This equipment will provide the first operational automated data processing, communications and display equipment. As next generation radars become available, RADAP will be expanded and become an integral part of the system. Analysis of the operational use of SVP data has proven complicated. Additional statistical analysis hardware has been constructed and recording equipment procured to allow computer analysis, hopefully leading to a better understanding and improved use of SVP data. The success of several RADAP output products, such as rainfall accumulation, depends on the non-weather echo rejection ability of the SVP equipment.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service

5.0036, AGRICULTURAL WEATHER PREDICTION - GENERAL AGRICULTURAL WEATHER GUIDANCE

G.M. Carter, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Techniques Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (8D43102)

OBJECTIVES: To develop automated techniques for prediction of weather variables of general importance to agriculture throughout the United States. These forecasts will be used primarily as guidance for NWS forecasters.

APPROACH: Techniques will be developed to combine MOS forecasts of several differing weather elements to obtain automated forecasts of agricultural parameters such as percent of possible sunshine, relative humidity, drying rates, and dew.

SUPPORTED BY U.S. Dept. of Commerce, National Weather Service, Systems Development Office

5.0037, AGRICULTURAL WEATHER PREDICTION - SPECIALIZED AGRICULTURAL WEATHER GUIDANCE

G.M. Carter, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Techniques Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (8D43101)

OBJECTIVE: To develop automated techniques for prediction of weather variables of particular importance to agriculture for several areas in the United States where agriculture is a major industry. These forecasts may be used as guidance for NWS forecasters or may be issued directly to the public.

APPROACH: We use the MOS concept to derive equations to predict elements such as air and soil temperature, precipitation, relative humidity, dew, and frost, and appropriately disseminate the resulting forecasts. The selection of weather elements and forecast areas is closely coordinated with the agricultural program leader in OM&O. Forecasts from the various operational agricultural guidance packages are carefully monitored.

PROGRESS: Five-day forecasts of maximum and minimum air temperatures and bare-ground and grassy-ground soil temperature, plus 3-day forecasts of minimum relative humidity and the probability of various amounts of precipitation are routinely transmitted to NWS forecasters in Indiana. In addition, 3-day forecasts of the probability of several intensities of ground condensation are now being developed.

Five-day forecasts of maximum and minimum air temperatures, plus 3-day forecasts of probability of precipitation amounts, are routinely transmitted to NWS forecasters in Michigan. In addition, 3-day forecasts of the probability of frost are now being developed.

SUPPORTED BY U.S. Dept. of Commerce, National Weather Service, Systems Development Office

5.0038, TERMINAL WEATHER PREDICTION - SHORT-RANGE AVIATION FORECASTING

R.G. Miller, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Techniques Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (8D590501)

OBJECTIVE: To develop and implement at AFOS field sites improved techniques to rapidly update forecasts for the weather elements required in the terminal forecast for projections in the range 0-to-12-h.

APPROACH: Locally available observations will be used in an equivalent Markov model to forecast the elements of the surface observation. The results will be compared to the results of the single station technique now used in the AFOS monitoring and updating system. Ways to incorporate the forecasts from other TDL techniques (e.g., model output on 2- to 6-h thunderstorms) into the AFOS field site short-range data base will be sought.

PROGRESS: Design of software for preparing observational data for input to Markov model on this new subtask began in July 1978.

SUPPORTED BY U.S. Dept. of Commerce, National Weather Service, Systems Development Office

5.0039, AFOS FORECAST APPLICATION - LOCAL MONITORING AND UPDATING

D.J. Vercelli, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Techniques Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (8C27021)

OBJECTIVE: To develop an automated procedure for AFOS systems at WSFO's which will monitor all surface aviation observation (SAO's) and terminal forecasts (FT's) within each WSFO's area of responsibility and (1) alert the forecaster when a problem or potential problem arises with the FT, and (2) provide objective guidance for preparing FT's.

APPROACH: AFOS system minicomputers at WSFO's will be programmed to compare each observation with the FT for that terminal and determine if a discrepancy exists with respect to: (1) official FT amendment criteria (problem), or (2) other criteria to be established (potential problem). When either condition occurs, the system will generate a message to the forecaster which will indicate the situation and provide an objective forecast of the surface weather elements. Forecasts will be produced by single station equations or, as necessary, generalized operator equations; both will use the latest observation to produce forecasts. The system will also produce guidance forecasts at any time upon request of the forecaster.

PROGRESS: All software has been converted and debugged for use on the Eclipse system. Internal acceptance testing by TDL has been completed. Forecast equations have been developed for the first 4 WSFO's implemented under AFOS and the aviation terminals under their area of responsibility.

5.0045, MINOR USE PESTICIDES RESEARCH, TO SUPPLEMENT THE IR-4 PROJECT (NORTH CENTRAL REGION)

R.J. Sauer, Michigan State University, Agricultural Experiment Station, Dept. of Entomology, *New Administration Bldg., East Lansing, Michigan* 48823 (0070856; MICL01235)

OBJECTIVE: To supplement the IR-4 Project effort through increasing the rate of data development (primarily efficacy, phytotoxicity and residue data) within the North Central Region's state agricultural experiment stations in order to expedite the clearance of pesticides for minor uses, principally on agricultural crops.

APPROACH: Solicit, classify and screen NC state requests for minor use pesticide clearances; secure commitments from requesting states to put out field plots necessary to collect adequate efficacy and phytotoxicity data and, where needed, generate sufficient sampling for residue analyses; provide for shipment of samples to the leader laboratory (MI AES) or the satellite laboratory (ND AES) or other laboratories as necessary; and transmit data to IR-4 Project Office for petition preparation and subsequent registration.

PROGRESS: During the period, under the direction of IR-4 Leader Laboratory program, 61 food use projects were initiated by cooperators in 9 of the North Central States (IL, IN, MI, MN, NB, OH, ND, SD, and WE). In addition, cooperators from CO and NC also submitted residue samples for projects simultaneously being conducted in the N.C. Region. Most of these field projects have been successfully completed (some were lost due to floods and other unforeseen circumstances) and the resultant residue samples submitted to the Analytical Laboratory of the Leader Laboratory and the satellite laboratory at North Dakota State University required more than 4,500 residue analyses. The field and residue results have been forwarded to IR-4 headquarters at Rutgers University and are in various stages of petition submission and review by EPA. Typical of the registrations received in the N.C. region was a Minnesota project for the use of malathion to control rice worms and maggots in wild rice.

J.D. Hair, University of North Carolina, North Carolina State University, Agricultural Experiment Station, Dept. of Zoology, *Raleigh, North Carolina* 27600 (0078711; NC05429)

OBJECTIVE: Determine population dynamics and habits of bobcat and otter in North Carolina. Determine and evaluate state-wide bobcat and otter habitat.

APPROACH: Bobcat and otter carcasses will be collected throughout the State in association with legal trapping seasons. Animals will be aged - examination of cementum annuli. Sex ratios will be determined. Reproductive tracts of females will be examined to determine reproductive rates, estrus periods and parturition dates. Based on above data, time-specific life tables will be developed. Food habits will be determined for radio-marked individuals and parameters describing habitat preferences will be quantified and plotted on computerized habitat maps. LANDSAT imagery will be used to document state-wide habitat potentials. Population and demographic data will be used to objectively assess harvest levels compatible with annual sustained yield management strategies.

5.0061, WASHINGTON DNR FOREST CLASSIFICATION

G.R. Johnson, Technicolor Graphic Services Inc., *Sioux Falls, South Dakota* 57198

STATE TO WHICH PROJECT PERTAINS: Washington.

The utility of digital analysis techniques for classifying western Washington forest lands with LANDSAT multispectral scanner (MSS) data is being investigated. The methodology for merging site-specific forest inventory data and terrain data with LANDSAT MSS data has been demonstrated.

Results of digital image processing techniques applied to LAMDSAT data will be compared to forest resource information to identify what forest resource groups can be identified with LANDSAT data. LANDSAT data will be classified into these resource groups and the classification accuracy estimated by using a simple random sampling scheme. Statistics to estimate percent correct classification as well as contingency tables which identify the nature and frequency of classification errors will be generated.

SUPPORTED BY U.S. Dept. of the Interior, Land Information & Analysis Office, EROS Data Center

5.0062, TARGETING, INVENTORYING AND MONITORING GROUND-WATER RESOURCES

J.R. Lucas, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, EROS Data Center, *Sioux Falls, South Dakota* 57198

STATES TO WHICH PROJECT PERTAINS: South Dakota, Iowa, Wisconsin, Kansas and other locations in the Gulf Coast and High Claims.

The application of LANDSAT multispectral scanner data for targeting sources of shallow ground water in glaciated terrains is being demonstrated and documented. Conventional photo interpretation procedures are being used to delineate surficial material patterns on LANDSAT imagery of eastern South Dakota, southeastern Wisconsin, and north central Iowa. Linear and curvilinear patterns, drainage patterns, and cover type patterns have been found to relate to occurrences of pre-glacial buried valleys and landforms associated with continental glaciation. Glacial phenomena characterized by stratified sand and gravel deposits are often significant shallow aquifers. Published hydrologic and geomorphic data are being used to assess the significance of patterns distinguished on LANDSAT imagery as they relate to potential sources of ground water in glaciated terrains.

SUPPORTED BY U.S. Dept. of the Interior, Land Information & Analysis Office, EROS Data Center

5.0063, WEED CONTROL IN VEGETABLES AND ORNAMENTALS AND THE EFFICIENCY OF HERBICIDES IN HORTICULTURAL SOILS

R.M. Menges, U.S. Dept. of Agriculture, Federal Research Office, Weed Control Research, *509 W. 4th St., Weslaco, Texas* 78596 (0017326; 7202-20280-001)

OBJECTIVE: Determine the effect of microclimate on the growth of weed species in vegetables and ornamentals and on herbicidal selectivity and movement and persistence in soils. Determine the feasibility of using infrared and ultra-high frequency (UHF) electromagnetic energy for weed control.

APPROACH: The herbicides glyphosate, bensulide, bromoxynil, butralin, methazole, and newly screened compounds will be applied by various soil incorporation and formulation techniques under different soil and plant microclimate conditions in cucurbit and root, bulb and cole crop vegetables and rosaceous ornamentals. Bioassays and chromatographic assays will be used to evaluate herbicidal activities. Herbicidal effectiveness, movement and persistence in soils and effect on plant growth and quality will be measured. UHF electromagnetic energy will be applied to the soil; the influence of soil texture and moisture, weed seed species, mass and moisture and depth of seed in soil will be evaluated. Weed species included will be London rocket (Simbrium irio L.), wild common sunflower (Helianthus annuus L.), and ragweed parthenium (Parthenium hysterophorus L.). The feasibility of infrared photography will be studied to remotely sense specific weed populations in crop production areas.

PROGRESS: Texas panicum, Palmer amaranth, and common purslane competed for yield of cucumber but were selectively controlled by soil-incorporated bensulide or butralin applied at planting and followed by post-emergence soil-incorporated butralin or trifluralin. Butralin persisted 11 weeks in soil to control Palmer amaranth but did not injure sorghum field-grown in rotation. Wild common sunflower populations of one plant per 7.6 cm of onion row competed for yield more than in populations of one plant per 76.2 cm of row in the first 9 weeks after emergence. The R haze (infinite reflectance) of Johnsongrass, lambsquarters and sowthistle leaves at 0.85 mm was significantly higher than sunflower, ragweed, or London rocket. Earth Resources Technology Satellite (LANDSAT-2) multispectral scanner (MSS) data were used to detect silverleaf sunflower from other plant species and to estimate its hectarage accurately.

5.0066, LANDSAT IMAGE MAPS OF CAPE COD

R.S. Williams, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, *12201 Sunrise Valley Dr., Mail Stop 710, Reston, Virginia* 22092 (E-0043)

STATE TO WHICH PROJECT PERTAINS: Massachusetts.

A variety of experimental LANDSAT image maps of Cape Cod and Cape Cod National Seashore (National Park Service) are in preparation by the U.S. Geological Survey's EROS Program. Project plans for FY 79 include: (1) the publication of a 1:250,000-scale LANDSAT image of Cape Cod in a poster format; (2) preparation of a 1:250,000-scale LANDSAT image map of Cape Cod, annotated with locations of geological and historical significance and with an extensive text; (3) preparation of an abstract on the use of LANDSAT 3 RBV images of Cape Cod to document and to delineate coast-line changes caused by the severe winter storm of 6-7 February 1978; and (4) to determine the feasibility of using LANDSAT 3 RBV images as 1:125,000-scale images bases for a geological map of Cape Cod.

5.0067, REMOTE SENSING AND ECOLOGICAL RESEARCH IN WETLANDS

V.P. Carter, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (NR 73-090)

Wetlands are poorly understood, hydrologically controlled environments. They are essential elements in estuarine, marine,

lacustrine, and riverine productivity. Information on (1) wetland hydrologic variables and their relation to wetland vegetation, (2) wetland dynamics and boundary fluctuations, (3) short and long term temporal changes, and (4) other ecological aspects as needed to improve our understanding of these ecosystems and to aid in classification and mapping. Wetland plants may serve as sensitive hydrologic indicators giving information on water (oxygen) stress or water quality parameters such as salinity, turbidity, pH, nutrients, or the presence of various pollutants.

To determine the spectral characteristics of wetland vegetation and relate these to interpretation of remotely sensed data. To develop improved methodology for mapping and classifying coastal and inland wetlands in cooperation with other interested government agencies and non-government groups or individuals. To examine seasonal and long-term changes in wetland ecology as related to changes in environmental parameters including hydrology, water quality, and land use. To assist with interdisciplinary studies requiring biological research and remote sensing such as the Potomac Estuary Study. To aid in the development of models that utilize remote sensing data as part of the prime data base.

Develop cooperative research projects. Cooperators include WRD Districts, TVA, Topo. Division (USGS), USFWS, NASA, JPL, interested state agencies and local groups, and others. Work with all types of remotely sensed data and available types of analysis equipment in order to achieve the best possible results in a variety of wetland studies. Assist in interdisciplinary studies by providing biological and remote sensing information that can be related to study objectives.

(1) Cooperative Project with TVA completed and final report prepared. (2) Wetland classification system for Tennessee Valley Region published. (3) Dismal Swamp Project - Map of Roads and Ditches Published, transition zone project started, additional observation wells have been installed and project revised to consider vegetative indicators. (4) Fish and Wildlife Classification System has been completed. (5) LANDSAT analysis in Alaska completed and report published. (Text Abridged)

5.0070, SUBSIDENCE OF RECLAIMED COAL MINE SPOILS, COLSTRIP, MONTANA
J.M. White, Carter Mining Co., *P.O. 209, Gillette, Wyoming* 82716 (I-0002)

STATE TO WHICH PROJECT PERTAINS: Montana.

Precise leveling surveys and ground and aerial inspections were conducted to determine the nature and practical effects of subsidence due to consolidation of reclaimed spoils at the Rosebud Mine, Colstrip, Montana. In spoils 30- to 40-years old, subsidence of spoils occurring since 1968 averages 0.1 m, and is of no practical effect. In spoils rehandled to form fill in 1968, subsidence approaches 0.25 m and is due to excessively steep side slopes, and to consolidation in response to saturation. Subsidence in areas strip mined since 1971 is as great as 0.6 m in restricted areas subject to saturation due to runoff and is apparently confined to the redistributed top-soil.

Research completed, report in preparation.

6.0015, INERTIAL AND GEOMETRIC PROPERTY BIODYNAMIC DATA REDUCTION SYSTEM B
R.R. Rasmussen, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF325190)

The use of biodynamics models for the prediction of body response during impacts and other abrupt accelerations encountered in Air Force operations is a feasible complementary research approach to actual experimentation with men and animals. However, the successful and meaningful application of biodynamic mathematical models requires not only a sound formulation of model structure, but also a detailed compilation and reduction of input data describing body properties, initial positions and interactive forces. The proper formatting and specification of the input data generally is accomplished by extensive analysis and reduction of information obtained from independent experiments. The present effort is for the development of an analysis system specifically suited to the reduction of body inertial, geometric and joint-segment property data. The data output of this system will have direct application to the articulated total body (ATB) model and models of similar structure, and will provide a convenient and efficient framework for the compilation of anthropometric and body inertial data readily applicable to analysis of body dynamics and specification of body surface geometry in any given configuration.

The implementation of this system will require the addition of a color graphics terminal to an existing PDP-8A computer and the development of software for body segment data manipulation and display. The system will be interfaced with the main CDC computer at Wright-Patterson AFB to allow data transfer between the two systems. The visual system will be used to display body segment surface-defining contours, various landmarks on the surface or interiorly defined points, axes systems associated with overall segment orientation, landmarks, principal inertial moments, preferred axes of rotation of the joint and for internal force application and adjacent segment-relative orientations. This data reduction system will be specifically applied to the generation of appropriate data sets for human subjects used in impact tests at AMRL/BB, which will in turn be used with the ATB model for model validation and investigation of various test parameter variations.

6.0016, BIODYNAMIC DATA BANK
Unknown, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF325140)

Man's capability to function safely and effectively under the severe dynamic stresses produced by high-performance aircraft must be continually reassessed, using actual dynamic tests with human and animal subjects, measurements of body tissue properties, predictive mathematical models, and evaluations of aircraft accident causes and results. These research methods produce voluminous data which must be stored and retrieved to be used as input data for future research and to prevent duplication of effort. The objective of this work unit is to organize the diverse data from biodynamic environmental research into a unified data bank with a single computerized index, so that researchers may gain access to past and current research data stored at AMRL.

A feasibility study will be performed to identify equipment costs, environmental and power supply needs of equipment, and factors which have contributed to the success or failure of similar data bank projects. The results of the feasibility study will be used in the engineering design study for the physical plant that will house the data and data-manipulation equipment. Equipment will be installed as funds permit and data storage will begin. Concurrently, the computerized index will be developed and procedures for operating the data bank and transmitting data to the using research engineers will be devised. When operational procedures and equipment are working satisfactorily, the approach will be confined to collecting, reformatting (if necessary), indexing, and disseminating data on a continuing basis.

7.0003, MATHEMATICAL ASPECTS OF AUTOMATIC MESH GENERATION
P.R. Eiseman, Scientific Research Associates Inc., *P.O. Box 498, Glastonbury, Connecticut* 06033 (DF055720; F49620-79-C-0132)

AF function - design of aerospace and reentry vehicles. Deficiency - there is a need for an efficient technique for the automatic generation of coordinates which can be used as a framework to numerically solve modeling equations in physics and engineering. Objective - to develop and analyze a mathematical theory for automatic coordinate generation. How work contributes - the technique to be developed can be applied to aerodynamic problems with complex geometries.

The following tasks are proposed: (1) To derive and analyze the multi-surface coordinate transformation with local continuous functions applied to the associated vector field interpolation. Included in the analysis will be an examination of the distribution of coordinate curves and of the constraints on curve shapes. Also, a simple computer code to demonstrate some of the mathematical results will be written. (2) To repeat task (1) after replacing the local continuous functions with continuous functions that have continuous first derivatives.

7.0004, DESIGN OF FAULT-TOLERANT COMPUTERS USING READ-ONLY MEMORIES AS BASIC BUILDING BLOCKS
D.K. Pradhan, Oakland University, Graduate School, *Rochester, Michigan* 48063 (DF055750; F49620-79-C-0119)

AF function - digital avionics systems. Important functions in growing numbers are being performed by digital computers on USAF aircraft. Deficiency - the correct functioning of the computer system is crucial since malfunctions could have catastrophic consequences for an aircraft. Such ultra-reliable computers are not yet available at affordable costs. Objective - to perfect methods for the design of fault-tolerant digital systems that use read-only memories as basic building blocks. How work contributes - the results of this research, if successful, would permit the construction of ultra-reliable computers which are essential for advanced technology aerospace vehicles.

The basic units of the planned computer architecture will be read-only memory chips. The capabilities of error-correcting codes will be exploited with the goal of achieving the required fault tolerance.

7.0005, NUMERICAL SOLUTION OF PARTIAL DIFFERENTIAL EQUATIONS
L.R. Scott, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Mathematics, *Ann Arbor, Michigan* 48104 (DF055940; F49620-79-C-0149)

AF function - the design of aerospace and reentry vehicles. The design of chemical laser devices. The study of nuclear weapons effects. Opportunity - to obtain better error bounds on the approximate solutions of the partial differential equations which model many of these design problems. Objective - to investigate maximum-norm estimates for finite element methods for certain types of partial differential equations. How work contributes - techniques may be developed which are useful in solving problems in laser and aircraft design.

The two investigators will study the following topics: (1) maximum-norm estimates for finite element methods for linear elliptic dirichlet problems and for nonlinear time-dependent problems, (2) numerical methods for the solution of some model equations for nonlinear dispersive waves, (3) spectral approximation of unbounded operators, (4) collocation-Galerkin method for nonlinear first-order hyperbolic systems, and (5) error estimates in negative order Sobolev norms for a class of finite element methods for linear first-order hyperbolic systems.

7.0008, IMPROVED ITERATIVE METHODS FOR SOLVING SPARSE SYSTEMS OF LINEAR EQUATIONS
R.S. Varga, Kent State University, School of Arts & Sciences, Dept. of Mathematics, *Hilltop Dr., Kent, Ohio* 44240 (DF056120; F49620-79-C-0175)

AF function - the design of chemical laser devices, the study of nuclear weapons effects on structures and aerospace vehicles. Deficiency - many problems in laser and nuclear phenomenology studies involve the solution of large, sparse linear

systems. Present techniques for solving such systems are not very efficient and often ineffective. Objective - to study, both theoretically and computationally, algorithms to solve iteratively large, sparse linear systems. How work contributes - algorithms to be developed may lead to useful computer codes needed at several AFSC laboratories.

One goal is to determine the exact class of all real, symmetric, positive definite, square matrices A for which A is stable for any choice of a graph G. Precise necessary and sufficient conditions for A to be stable will be pursued. Then the implicit conjugate gradient method coupled with stable factorizations will be used to solve the linear system. Also, acceleration of this technique by the block successive over-relaxation method and by the Chebyshev semi-iterative method will be investigated both theoretically and numerically. Another goal is to study symbolic methods to evaluate function-space integrals. Specifically, MACSYMA will be used to evaluate Wiener integrals. The method involves a functional Monte Carlo algorithm which will be extended to handle a variety of differential equations, including elliptic systems.

7.0009, INFORMATION ASSESSMENT FOR AIRBORNE C2

S. Stark, U.S. Dept. of Defense, Navy, Naval Air Development Center, Software & Computer Directorate, *Warminster, Pennsylvania* 18974 (DN081125)

Systematically develop, test and evaluate automation decision-aiding techniques, algorithms, and related man-machine interfaces to develop technology products applicable to airborne command and control systems and operations.

Establish a systematic standardized analysis methodology to identify and parameterize airborne command and control decision requirements to allow experimental demonstration/evaluation of significant automation decision-aiding algorithms and processing system configuration requirements. Perform investigation analysis to apply state-of-the-art artificial intelligence approaches to improve mission performance via automation and decision aid to human operator-decision functions. Those situations where application development of automation decision aiding would have the greatest positive impact will be identified and appropriate algorithms, man-machine interfaces, lab tests, test procedures, simulation, and validation criteria will be implemented, demonstrated and evaluated. Work will also be performed on contract under work unit ZH302 for program element 62757N, and work units AJ601B and AJ601B1.

8.0012, LOW-TEMPERATURE STUDIES OF DEFECTS AND SOLIDS

A.C. Anderson, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Physics/Materials Research Laboratory, *207 Engineering Hall, Urbana, Illinois* 61801 (EY-76-C-02-1198)

This purpose of this project is to obtain experimental data on a variety of defect structures, both to provide a basic understanding of the defect and to permit prediction of the behavior of bulk properties when defects are present. Reduced temperatures (0.02-300 K) are used in the investigation since such data are often more amenable to theoretical interpretation and thus provide a foundation for a general theoretical development, and because some important phenomena, such as superconductivity, occur only at low temperatures. Several measurement techniques are used: thermal and electrical conductivity, specific heat, thermal expansion, ultrasonics, and dielectric polarization. Low-temperature thermal conductivity measurements, for example, provide both technical data (appropriate to cryogenic engineering application) and a source of very-high-frequency phonons to probe the dynamic response of defect structures. Three generalized classes of defects are being investigated, namely dislocations, interface and surfaces, and disordered and composite materials, including polymers and superionic conductors.

SUPPORTED BY U.S. Dept. of Energy

8.0013, EVAPORATION OF A SOLID DEUTERIUM PELLET IN A CONTROLLED THERMONUCLEAR PLASMA

J. Dorning, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Nuclear Engineering, *207 Engineering Hall, Urbana, Illinois* 61801

The evaporation rate and total penetration distance of a solid deuterium pellet after injection into a thermonuclear plasma have been studied. Detailed computer calculations in which hydrodynamics and phase transition thermodynamics are treated in a fully self-consistent manner have been done. Self-consistent shielding effects produced by the expanding evaporated material have been included. Both long-range-force energy exchanges among charged particles and short-range-force interactions between charged and neutral species have been investigated since the evaporation times of these fuel pellets are very sensitive to energy exchange mechanisms.

8.0015, NUCLEAR MAGNETIC RESONANCE IN SOLIDS

C.P. Slichter, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Physics/Materials Research Laboratory, *207 Engineering Hall, Urbana, Illinois* 61801 (EY-76-C-02-1198)

The interests of this group are in the fundamentals of solid-state physics, including many-body problems, phase transitions, and exotic properties. At low temperatures, iron atoms in copper exhibit a phenomenon called the Kondo effect as a result of the exchange coupling of the iron atom to the conduction electrons. The explanation has challenged theorists since this is a true many-body problem. We are studying it by using ultrasensitive nuclear magnetic resonance to measure the conduction electron spin polarization which the exchange coupling produces at copper nuclei which are near neighbors to the iron atoms. In most metals, the electron charge distribution is uniform, apart from the periodic density changes arising from the presence of the nuclei. Several years ago, Overhauser proposed that in some cases the stable state would be non-uniform, i.e., there would be a charge density wave, the wavelength of which bore no relation to the lattice periodicity. Such waves have recently been found in compounds such as NbSe2 and TaS2. These materials also exhibit superconductivity, and there is speculation that the two phenomena are related. The properties of such crystals, especially emphasizing the charge density waves, are under study. A new technique has been invented for measuring electrical conductivity. The application of it to the organic conductor TTF-TCNQ has been the subject of intense study since Heeger first proposed it might be a high-temperature superconductor.

Unknown, Johns Hopkins University, Graduate School, *34th & Charles Sts., Baltimore, Maryland* 21218 (EY-76-S-02-3274)

We propose to complete the system designed to study energetic central collision of heavy ions to study the properties of nuclear matter via the emission of gamma rays. An initial study proved very successful and the group is approved for further study beginning in 1978. Follow-up studies of high-spin nuclear states resulting from pion capture are in progress and will continue in the future. High-precision data using a curved crystal spectrometer in collaboration with groups from Yale and Columbia will be carried out at Nevis as an additional program to study the excitation of nuclei via pion capture.

The experiment on the nuclear moments of beta emission is being completed and will take new directions in the future. The programs on electrons and positrons from high-energy collisions will continue. Some future experiments are also being planned for the measurement of linear polarization of gamma rays resulting from high-spin excitation of nuclei.

RESULTS: A new program studying the behavior of nuclear matter under very high excitation was begun at the Bevatron with experiments designed to study the gamma radiation emitted from central collision of heavy ions. A preliminary experiment showed the feasibility of the system and gave the first results of correlations of gamma rays with such collisions. Studies of electrons resulting from heavy-ion collisions using a special high acceptance beta spectrometer were made indicating the beginnings of effects that are complements of the so-called combined atom X-ray phenomena.

8.0019, PLASMA PHYSICS OF PELLET FUSION
Unknown, University of Maryland, College Park Campus, Graduate School, *College Park, Maryland* 20742 (EY-76-S-05-5000)

Pellet fusion involves both the design of appropriate pellets and the development of a pulsed power technology (electron, ion, or laser beams) capable of igniting the pellets. We are investigating several plasma problems that arise in this field. (1) Various mechanisms are expected to generate magnetic fields in target pellets. The generation and evolution of these fields during deposition and compression are being analyzed. (2) Heavy ion beams in the 10-100 GeV range have been proposed for pellet ignition. We are developing a model for the propagation of one such focussed ion beam through the relatively dense gas that may exist in the target chamber of a reactor. Our model contains the effects of beam ion stripping, background plasma generation by the beam ions, and electron avalanching in the electric fields produced by the ion pulse. Charge and partial current neutralization, together with stability conditions and the effects of pre-ionization will be calculated. (3) The production of hard X-rays by heavy multi-GeV ions slowing down in a high atomic weight target (e.g., the outer layer of a pellet) is being calculated.

PURPOSE: Investigate the feasibility of fast theta pinch heating and its compatibility with confinement in a toroidal configuration with a circular cross-section for the 10/sup 13/-10/sup 15/cubic cm density regime. APPROACH: A circular cross-section torus (THOR), 40 cm minor and 1 m major diameter have been constructed. The input energy sources are six 100 kJ swinging LC generators with an initial dI/dt of 10/sup 12/A/sec. each. A variable bias field of 0 to 1 kg can be provided. A linear fast theta pinch (FTP - 46 cm diameter, 1 m length, 30 kJ input energy, initial dI/dt equals 10/sup 12/A/sec.) is used to continue heating and diagnostic experiments in the 10/sup 12/ by 10/sup 13/ cm/sup 3/ density regime. A smaller theta pinch (STP15 cm diameter, 30 cm length, B approximately 17 kG) enables extension of investigations to densities greater than 10/sup 15/ with t/sub i/ approximately 1 keV. Unknown, Massachusetts Inst. of Technology, Graduate School, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (EY-76-S-02-2766)

The purpose of this program is the study of the dynamics of charged particle motions in relativistic diodes subjected to a transverse magnetic field. To date we have concentrated our investigation on cylindrical diodes acted upon by externally generated magnetic fields. The parapotential flow was unstable, as evidenced by copious microwave emission. During the coming year we propose to investigate the particle dynamics in pinched diodes in which the magnetic field is self-generated by the electron flow. Pinching will be initiated by laser generation of anode blow-off plasma. Microwave emission will be used as a diagnostic indicator of instabilities.

J.H. Macek, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Lincoln, Nebraska* 68508 (EG-77-S-02-4379)

Direct charge exchange between individual ions is expected to be the principal loss mechanism and limiting design factor in any heavy ion-driven inertial fusion energy production scheme. Estimates are required of the direct charge exchange cross-sections between singly ionized heavy elements in the KeV energy range. This project will use the molecular perturbed stationary state approximation method to calculate charge exchange cross-sections. The study will assess the need to take into account metastable, intermediate charge states. Results of this technique will be compared with those obtained by other procedures. (DOE/ER-0002)

Analytical study of RF plasma heating in toroidal devices, nonlinear drift waves and drift waves in magnetic shear geometry. Computer-generated analytical results on parametric instabilities arising in RF heating of plasmas.

RESULTS: The modification of the drift wave spectrum by lower hybrid heating waves was studied. It was shown that zero frequency drift modes are not unstable in Tokamaks. A dispersion relation for nonlinear scattering of drift waves has been derived. Progress has been made in automating the calculation of parametric processes analytically by computer.

8.0036, GENERATION AND FOCUSSING OF PULSED INTENSE ION BEAMS
R.N. Sudan, Cornell University, Ithaca Campus, School of Engineering, Dept. of Applied Engineering & Physics, *242 Carpenter Hall, Ithaca, New York* 14853 (ES-77-S-02-4209)

The proposed work involves the focussing of intense ion beams in a spherical magnetically insulated diode to obtain a point focus. The ability to focus such beams by quadrupole magnetic lenses will also be examined. Improvements in the divergence of the emitted beam from the diode will be sought. Propagation and stability of the beams will be studied in low pressure gas.

RESULTS: Intense ion beams have been focussed in cylindrical, magnetically insulated diodes to a line focus at the current density of approximately 0.5 kA and a total current close to 100 kA. Intense ion beams to the order of 10 kA at a few hundred kV have been magnetically focussed by a dipole lens. It has been found that the propagation of the ion beams can be explained in terms of charged and current neutralized beams where the individual particles follow ballistic trajectories.

G.M. Vahala, College of William & Mary, Williamsburg College, School of Arts & Sciences, Dept. of Physics, *Ewell Hall, Williamsburg, Virginia* 23185 (EY-76-S-05-5260)

It now seems quite natural to attain a high Beta Tokamak state by means of intense neutral beam injection. Clarke has shown that such a sequence of equilibria can be flux conserving (FCT concept). Very extensive (and non-trivial) numerical codes have been developed to study such FCT equilibria. We propose to obtain analytic solutions with nonlinear q (psi), p (psi) profiles by means of perturbation techniques. This analytic work is crucial, not only to better understand the results from the numerical codes, but because it will open the door to further analytic work on transport and stability.

The above approach and philosophy is the standard one performed in magnetic confinement studies. We believe it is of utmost importance to study non-perturbative non-linear MHD--in particular, a statistical approach to magnetic confinement. Recently, we (with Leaf Turner of LASL) have been successful in applying a statistical approach (used in fluid turbulence with periodic boundary conditions) to 3-D MHD turbulence in cylindrical geometry. We propose to apply this technique to considering the disruptive instability, magnetic island formation, transport, field reversal in toroidal z-pinches.

INTERACTION BETWEEN A NORMAL SHOCK WAVE AND A TURBULENT BOUNDARY LAYER AT HIGH TRANSONIC SPEEDS. PART 1: PRESSURE DISTRIBUTION. PART 2: WALL SHEAR STRESS. PART 3: SIMPLIFIED FORMULAS FOR THE PREDICTION OF SURFACE PRESSURES AND SKIN FRICTION Final Report
T. C. Adamson, Jr., M. S. Liou, and A. F. Messiter. Sep. 1980 136 p refs
(Grant NsG-1326)
(NASA-CR-3194) Avail: NTIS HC A07/MF A01 CSCL 02A

An asymptotic description is derived for the interaction between a shock wave and a turbulent boundary layer in transonic flow, for a particular limiting case. The dimensionless difference between the external flow velocity and critical sound speed is taken to be much smaller than one, but large in comparison with the dimensionless friction velocity. The basic results are derived for a flat plate, and corrections for longitudinal wall curvature and for flow in a circular pipe are also shown. Solutions are given for the wall pressure distribution and the shape of the shock wave. Solutions for the wall shear stress are obtained, and a criterion for incipient separation is derived. Simplified solutions for both the wall pressure and skin friction distributions in the interaction region are given. These results are presented in a form suitable for use in computer programs.

ADVANCED STRUCTURES MAINTENANCE CONCEPTS Final Report, Aug. 1979 - Mar. 1980
Thomas N. Cook, Michael G. Adams, Rocco R. Digenova, and David P. Maass. Jun. 1980 120 p
(Contract DAAK51-79-C-0027; DA Proj. 1L1-62209-AH-76)
(AD-A087609; SER-510029; USAAVRADCOM-TR-80-D-16)
Avail: NTIS HC A06/MF A01 CSCL 11/4

A detailed R M analysis was conducted for an advanced composite rear fuselage for the UH-60A Black Hawk helicopter. Methods of improving the damage tolerance of the structure in areas of high impact exposure were evaluated. Cost effective R M options were recommended for incorporation in the design. Materials and techniques for performing rapid, low skill level repair of composite airframe structures in the Army field environment were investigated. Epoxide impregnated preform patches were evaluated for repair of primary structural components. Polyurethane foam kits were studied as a potential method of creating forms and mandrels for laminating repairs on the aircraft. A modular design concept was developed for the UH-60A composite rear fuselage. Module replacement methods were defined. Studies were conducted to assess the economics of modular maintenance versus conventional types of repair. Potential improvements in combat repairability were evaluated. GRA

GENERAL AVIATION ACTIVITY AND AVIONICS SURVEY, 1978 Annual Summary Report, CY 1978
Judith C. Schwenk. Mar. 1980 161 p refs Sponsored by DOT
(AD-A087653; TSC-FAA-80-6; FAA-MS-80-5) Avail: NTIS HC A08/MF A01 CSCL 01/2

This report presents the results and a description of the 1978 General Aviation Activity and Avionics Survey. The survey was conducted during early 1979 by the FAA to obtain information on the activity and avionics of the United States registered general aviation aircraft fleet, the dominant component of civil aviation in the U.S. The survey was based on a statistically selected sample of about 13.3 percent of the general aviation fleet and obtained a response rate of 74 percent. Survey results are based upon responses but are expanded upward to represent the total population. Survey results revealed that during 1978 an estimated 39.4 million hours of flying time were logged by the 198,778 active general aviation aircraft in the U.S. fleet, yielding a mean annual flight time per aircraft of 197.7 hours. The active aircraft represented 85 percent of the registered general aviation fleet. The report contains breakdowns of these and other statistics by manufacturer/model group, aircraft type, state and region of based aircraft, and primary use. Also included are fuel consumption, lifetime airframe hours, avionics, and engine hours estimates. GRA

DEVELOPMENT OF AN EFFECTIVENESS PLANNING AND EVALUATION MODEL FOR AIR FORCE MAINTENANCE ORGANIZATIONS Final Scientific Report, 1 May 1979 - 15 Feb. 1980
Hewitt H. Young. 1 Apr. 1980 216 p refs
(Grant AF-AFOSR-0111-79; AF Proj. 2313)
(AD-A088061; ASU-ERC-R-80016; AFOSR-80-0598TR) Avail: NTIS HC A10/MF A01 CSCL 15/5

A preliminary effort was made to generate a survey-supported model which would (1) permit periodic evaluation of the performance effectiveness of an Air Force maintenance squadron and (2) highlight equipment and human resource factors which are contributing either positively or negatively to maintenance squadron performance. The model is generated from survey data, collected from a stratified sample of maintenance technicians and their shift supervisors, and processed by means of a stepwise, linear multiple regression statistical package to provide a performance prediction equation. Factors which surface as significant in the equation indicate positive and negative contributions to squadron performance effectiveness. The modeling effort is based on studies with the 82nd Air Training Command Wing at Williams AFB and the 405th Tactical Air Command Wing at Luke AFB, both in Arizona. The model was validated using immediate supervisor ratings of maintenance technician performance in speed and quality of work, averaged across a squadron. Based on the analyses and results of studies covering two maintenance squadrons at Williams AFB and three maintenance squadrons at Luke AFB, the model provides

excellent predictions of squadron performance effectiveness and highlights significant contributing factors. GRA

THE US AIR SERVICE IN WORLD WAR I. VOLUME 3: THE BATTLE OF SAINT MIHIEL
Maurer Maurer, comp. 1979 827 p refs Prepared in cooperation with Albert F. Simpson Historical Research Center, Maxwell AFB, Ala. 3 Vol.
(AD-A088294) Avail: NTIS HC A99/MF A01 CSCL 15/7

The Battle of Saint Mihiel is of singular significance in the history of United States participation in World War I. It was the first battle in France in which an American army fought under the American flag. The U.S. offensive gained all objectives quickly and with relatively few casualties. It eliminated a menacing salient that had threatened the Allied battleline for four years, and it cleared the way for new offensive that would end the war in less than two months. Aerial operations at Saint Mihiel made the battle an important event in the history of U.S. Military aviation. It was, primarily, Col. William (Billy) Mitchell's show. He put together the largest air force ever committed to battle and drew up the plan for its employment. This volume presents documents relating to the role of U.S. aviation in the Battle of Saint Mihiel. It is the third in a series of four volumes that the Office of Air Force History is publishing on the U.S. Air Service in World War 1. GRA

EFFECTS OF AXISYMMETRIC CONTRACTIONS ON TURBULENCE OF VARIOUS SCALES Final Report
Jimmy Tan-atichat, Hassan M. Nagib, and Robert E. Drubka Sep. 1980 376 p refs
(Grant NsG-3220)
(NASA-CR-165136; R80-1) Avail: NTIS HC A17/MF A01 CSCL 01A

Digitally acquired and processed results from an experimental investigation of grid generated turbulence of various scales through and downstream of nine matched cubic contour contractions ranging in area ratio from 2 to 36, and in length to inlet diameter ratio from 0.25 to 1.50 are reported. An additional contraction with a fifth order contour was also utilized for studying the shape effect. Thirteen homogeneous and nearly isotropic test flow conditions with a range of turbulence intensities, length scales and Reynolds numbers were generated and used to examine the sensitivity of the contractions to upstream turbulence. The extent to which the turbulence is altered by the contraction depends on the incoming turbulence scales, the total strain experienced by the fluid, as well as the contraction ratio and the strain rate. Varying the turbulence integral scale influences the transverse turbulence components more than the streamwise component. In general, the larger the turbulence scale, the lesser the reduction in the turbulence intensity of the transverse components. Best agreement with rapid distortion theory was obtained for large scale turbulence, where viscous decay over the contraction length was negligible, or when a first order correction for viscous decay was applied to the results. CALCULATION OF THE TRANSIENT MOTION OF ELASTIC AIRFOILS FORCED BY CONTROL SURFACE MOTION AND GUSTS
A. V. Balakrishnan and John W. Edwards Aug. 1980 167 p refs
(Contract NAS4-2472)
(NASA-TM-81351; H-1125; Rept-505-36-24) Avail: NTIS HC A08/MF A01 CSCL 01A

The time-domain equations of motion of elastic airfoil sections forced by control surface motions and gusts were developed for the case of incompressible flow. Extensive use was made of special functions related to the inverse transform of Theodorsen's function. Approximations for the special cases of zero stream velocity, small time, large and time are given. A numerical solution technique for the solution of the general case is given. Examples of the exact transient response of an airfoil are presented. T.M.

A STUDY OF TRANSIENT ABLATION OF BLUNT BODIES Ph.D. Thesis
Kazuhiro Nakahashi (National Aerospace Lab., Kakuda, Japan) Jul. 1980 29 p refs
(ISAS-581-Vol-45-No-6; ISSN-0372-1418) Avail: NTIS HC A03/MF A01

The results of a numerical approach to transient thermal response of ablating blunt bodies made of Teflon are given. A simplified thermal model was proposed to solve thermal field in the ablator having phase transition. The viscous shock-layer flow and heat conduction in the ablator were calculated using an alternately iterative scheme, and the transient thermal response of the ablating bodies is discussed in detail with emphasis on the effects of chemical reactions of the ablation products. The chemical reactions such as combustion of the ablation products in the shock layer modify characteristics of the wall heating rate significantly. The existing simple formula, which is proposed for estimating surface heating rate with reactive coolant injection, cannot predict the real heating characteristics over the ablating surface. T.M.

PRESSURE DATA FOR FOUR ANALYTICALLY DEFINED ARROW WINGS IN SUPERSONIC FLOW
James C. Townsend Sep. 1980 128 p refs
(NASA-TM-81835; L-13703) Avail: NTIS HC A07/MF A01 CSCL 01A

In order to provide experimental data for comparison with newly developed finite difference methods for computing supersonic flows over aircraft configurations, wind tunnel tests were conducted on four arrow wing models. The models were machined under numeric control to precisely duplicate analytically defined shapes. They were heavily instrumented with pressure orifices at several cross sections ahead of and in the region where there is a gap between the body and the wing trailing edge. The test Mach numbers were 2.36, 2.96, and 4.63. Tabulated pressure data for the complete test series are presented along with selected oil flow photographs. Comparisons of some preliminary numerical results at zero angle of attack show good to excellent agreement with the experimental pressure distributions. Author

AERODYNAMIC CHARACTERISTICS OF THREE HELICOPTER ROTOR AIRFOIL SECTIONS AT REYNOLDS NUMBER FROM MODEL SCALE TO FULL SCALE AT MACH NUMBERS FROM 0.35 TO 0.90
Kevin W. Noonan and Gene J. Bingham Sep. 1980 85 p refs Prepared in cooperation with Army Aviation Research and Development Command, St. Louis, Mo.
(DA Proj. 1L1-61102-AH-45)
(NASA-TP-1701; L-13139; AVRADCOM-TR-80-B-5) Avail: NTIS HC A05/MF A01 CSCL 01A

An investigation was conducted in the Langley 6 by 28 inch transonic tunnel to determine the two dimensional aerodynamic characteristics of three helicopter rotor airfoils at Reynolds numbers from typical model scale to full scale at Mach numbers from about 0.35 to 0.90. The model scale Reynolds numbers ranged from about 700,00 to 1,500,000 and the full scale Reynolds numbers ranged from about 3,000,000 to 6,600,000. The airfoils tested were the NACA 0012 (0 deg Tab), the SC 1095 R8, and the SC 1095. Both the SC 1095 and the SC 1095 R8 airfoils had trailing edge tabs. The results of this investigation indicate that Reynolds number effects can be significant on the maximum normal force coefficient and all drag related parameters; namely, drag at zero normal force, maximum normal force drag ratio, and drag divergence Mach number. The increments in these parameters at a given Mach number owing to the model scale to full scale Reynolds number change are different for each of the airfoils. R.K.G.

A NEW THEORY FOR RAPID CALCULATION OF THE GROUND PATTERN OF THE INCIDENT SOUND INTENSITY PRODUCED BY A MANEUVERING JET AIRPLANE

Raymond L. Barger. Washington, Sep. 1980. 24 p. refs.
(NASA-TP-1733; L-13629) Avail: NTIS. HC A02/MF A01. CSCL 01A.

An approximate method for computing the jet noise pattern of a maneuvering airplane is described. The method permits one to relate the noise pattern individually to the influences of airplane speed and acceleration, jet velocity and acceleration, and the flight path curvature. The analytic formulation determines the ground pattern directly without interpolation and runs rapidly on a minicomputer. Calculated examples including a climbing turn and a simple climb pattern with a gradual throttling back are presented. T.M.

A CORRELATION METHOD TO PREDICT THE SURFACE PRESSURE DISTRIBUTION OF AN INFINITE PLATE OR A BODY OF REVOLUTION FROM WHICH A JET IS ISSUING

Final Report, 1 Dec. 1978 - 1 May 1980

Stanley C. Perkins, Jr. and Michael R. Mendenhall. Jan. 1980. 200 p. refs.
(Contract NAS2-10125)
(NASA-CR-152345; NEAR-TR-211) Avail: NTIS. HC A09/MF A01. CSCL 01A.

A correlation method to predict pressures induced on an infinite plate by a jet exhausting normal to the plate into a subsonic free stream was extended to jets exhausting at angles to the plate and to jets exhausting normal to the surface of a body revolution. The complete method consisted of an analytical method which models the blockage and entrainment properties of the jet and an empirical correlation which accounts for viscous effects. For the flat plate case, the method was applicable to jet velocity ratios up to ten, jet inclination angles up to 45 deg from the normal, and radial distances up to five diameters from the jet. For the body of revolution case, the method was applicable to a body at zero degrees angle of attack, jet velocity ratios 1.96 and 3.43, circumferential angles around the body up to 25 deg from the jet, axial distances up to seven diameters from the jet, and jet-to-body diameter ratios less than 0.1. R.C.T.

HC A03/MF A01 CSCL 20/4

The generation of vortical flow abreast the lateral edge and downstream of a lifting surface is examined from the basic equations of fluid mechanics using the Oseen approximation. Coupled equations which arise from matching inner and outer expansions about a conical region are derived. Their numerical solution (not attempted here) is expected to provide a more accurate prediction of the pressure distribution along the vortex axis and, hence, to a reliable prediction of inception of tip cavitation as a function of Reynolds number, and the loading on the lifting surface in the vicinity of the tip. GRA

IMPROVEMENTS TO THE NSWC AERODYNAMICS PREDICTION PROGRAM OF PARTICULAR SIGNIFICANCE FOR BOMBS
L. M. Sheppard Mar. 1980 22 p refs
(AD-A087769; WSRL-0146-TR) Avail: NTIS
HC A02/MF A01 CSCL 19/2

During use of the NSWC missile aerodynamics prediction program, a number of deficiencies have been found. Because these deficiencies are important on bombs, simple but effective corrections have been devised. Details are given of a revised expression for boattail normal force at subsonic and transonic speeds. This is necessary because the program gives normal force results that are much too large in magnitude when the base diameter is small. Also included is a correction for boattail center of pressure. In order to cope with fuses and lugs on bombs, allowances have been devised for truncated nose viscous separation pressure drag at subsonic and transonic speeds, and for excrescence drag at all speeds. The program includes an allowance for viscous separation drag at the nose shoulder, at transonic speeds. Finally, a correction has been included to account for the wave drag due to large amounts of nose blunting, including the region near the drag rise Mach number. Comparisons are made with experimental data from a number of sources, in order to show that the modified program is effective and useful. GRA

COMPUTATION OF THREE-DIMENSIONAL SUPERSONIC VISCOUS FLOWS IN INTERNAL CORNERS Final Report, 15 Jan. 1979 - 15 Jan. 1980
John C. Tannehill and Dale A. Anderson Mar. 1980 53 p refs
(Contract F33615-79-C-3000; AF Proj. 2307)
(AD-A085857; AFWAL-TR-80-3017) Avail: NTIS
HC A04/MF A01 CSCL 20/4

Three dimensional, supersonic viscous flows in internal corners are computed by solving the unsteady Navier-Stokes equations subject to a local conical assumption. These governing equations are solved using MacCormack's explicit finite difference scheme. A generalized coordinate system is employed which permits the grid to be refined near walls as well as in interaction regions so that viscous details can be properly resolved. Both shock fitting and shock capturing techniques are used. Two different corner flowfields are computed and the results are compared with experimental data and previous numerical solutions of the complete Navier-Stokes equations. GRA

VORTEX SHEDDING FROM STATIONARY AND VIBRATING BLUFF BODIES IN A SHEAR FLOW Interim Report, FY 1980
Owen M. Griffin 11 Aug. 1980 43 p refs
(AD-A088083; NRL-MR-4287) Avail: NTIS
HC A03/MF A01 CSCL 20/4

If a fluid is in relative motion past a stationary bluff, or unstreamlined, structure and the vortex shedding frequency approaches one of the natural frequencies of the structure, then resonant flow-induced oscillations of the structure can occur when the damping of the system is sufficiently low. These resonant oscillations are accompanied by a 'lock-on' or capture of the vortex shedding frequency by the vibration frequency over a range of flow speeds, and this lock-on effect causes the wake and the structure to oscillate in unison. The periodic lift and the mean drag forces are amplified as a result of the vibrations, and changes in these fluid forces are closely related to the changes that occur in the flow field in the near wake of the body. Many practical ocean and wind engineering situations involve lightly damped structures that are located in flows of air or water that are nonuniform along the length of the structure. The primary difference between a uniform flow and a shear flow is the presence and added complexity, in a shear flow, of vorticity whose vector is normal to the plane of the flow. When the incident flow approaches the body this vorticity is turned into the flow direction and interacts with the vortices which are shed from the body into the wake. GRA

THEORETICAL CALCULATION OF VISCOUS-INVISCID TRANSONIC FLOWS Research and Development Report
Tsze C. Tai Aug. 1980 66 p refs Presented at the 1979 - 1980 Lecture Ser. on Shock-Boundary Layer Interaction in Turbomachines at the Von Karman Inst. for Fluid Dyn., Belgium, 2-6 Jun. 1980
(AD-A087745; DTNSRDC-80/104; DTNSRDC/AERO-1268)
Avail: NTIS HC A04/MF A01 CSCL 20/4

The current status of computational capabilities for calculating viscous inviscid transonic flows other than the solution of Navier-Stokes equations is presented. Techniques for solving transonic inviscid flows and compressible integral boundary layer methods are reviewed, and systems for strong viscous inviscid

interactions are described. Generally, the transonic viscous inviscid interaction is characterized by a subcritical boundary layer with a supersonic outer stream. The thickening boundary layer produces a pressure rise which causes further thickening of the boundary layer. The physical flow is best modeled by direct coupling of the viscous and inviscid systems to allow immediate interaction between the shock wave and the boundary layer. It appears that the method of integral relations for the outer inviscid flow, combined with an integral boundary layer scheme, possesses such a capability. To facilitate the computation, a hybrid approach to the transonic inviscid solution, which consists of the finite difference method for solving the overall transonic inviscid potential flow field and the method of integral relations for solving Euler's equation in the shock region, is suggested. Finally, the application of the steady two dimensional methods to the quasi two dimensional problem on axisymmetric stream surface of a cascade flow at transonic speeds is discussed. GRA

HYPERSONIC WIND TUNNEL STUDY OF A 15 DEG - 30 DEG HALF ANGLE CONCAVE BICONIC MODEL UP TO HIGH ANGLES OF ATTACK Final Scientific Report, 1 Dec. 1978 - 30 Nov. 1979
Bryan E. Richards. Dec. 1979. 40 p. refs.
(Grant AF-AFOSR-3474-78; AF Proj. 2307)
(AD-A088129; VKI-I-62) Avail: NTIS HC A03/MF A01 CSCL 16/3

Heat transfer and pressure measurements have been measured on a 15 - 30 deg half angle biconic model with a blunt nosetip in the Von Karman Institute Longshot free piston tunnel at Mach 15 and 20 Reynolds numbers between one and five million based on model base diameter. The test flow parameter closely simulated reentry aerodynamic conditions. The angle of attack of the model was varied from 0 to 20 deg. Information derived from the measurements and also schlieren pictures enabled understanding of the effects of Mach number, Reynolds number and flow incidence on the flow over the model and the location and size of heat transfer peaks. INVESTIGATION OF TRANSIENT INDUCED AERODYNAMICS IN A MOVING DECK ENVIRONMENT Final Report, Oct. 1978 - Sep. 1979
Robert E. Palmer. 7 Feb. 1980. 81 p. refs.
(WF41400000)
(AD-A088164; NADC-79260-60) Avail: NTIS HC A05/MF A01 CSCL 01/2

Operating a V/STOL aircraft in ground effect can greatly alter the aerodynamic forces and moments acting on the aircraft. By introducing a moving ground plane, such as the deck of a DD963 class destroyer, the complexity of the resulting flow field is significantly increased. This added complexity makes it even more difficult to perform successful shipboard takeoff and recovery operations. In order to fully utilize the potential shipboard operational capabilities of V/STOL aircraft a better understanding of these phenomena is required. To accomplish this, the effects of basic single axis deck motions must be examined. Analysis of these independent deck motions (heave, pitch, roll) enable the development of prediction techniques applicable to a preliminary design environment. These methods provide the designer a tool for estimating the transient induced aerodynamics acting on a V/STOL aircraft in a moving deck environment. Data for the three fan subsonic V/STOL configuration was selected for study. GRA

FEASIBILITY STUDY OF APPLYING LAMINAR FLOW CONTROL TO AN LTA VEHICLE Final Report
Dwight J. Warner, Suphi Ozgur, and Wayne W. Haigh. Apr. 1980. 49 p. refs.
(Contract N00140-79-C-6565)
(AD-A088148; DT-7909-14; NADC-80144-60) Avail: NTIS HC A03/MF A01 CSCL 20/4

The feasibility of applying laminar boundary-layer control with body shaping to a high altitude, Lighter-Than-Air vehicle was investigated. Solar-radiation-induced surface heating was shown to have a destablizing effect on laminar flow and caused the laminar flow to break down on regions of the vehicle surface exposed to high levels of solar radiation. Aerodynamic drag estimates were made for the vehicle. Surface waviness and roughness criteria for achieving laminar flow were determined. GRA

03 AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; and aircraft accidents.

NASA AVIATION SAFETY REPORTING SYSTEM Quarterly Report, 1 Oct. - 31 Dec. 1978
Apr. 1980. 39 p. refs. Prepared in cooperation with Battelle Columbus Labs., Mountain View, Calif.
(NASA-TM-81197; A-8176; QR-10) Avail: NTIS HC A03/MF A01 CSCL 01C

Knowledge of limitations of the Air Traffic Control system in conflict avoidance capabilities is discussed. Assumptions and expectations held by by airmen regarding the capabilities of the system are presented. Limitations related to communication are described and problems associated with visual approaches, airspace configurations, and airport layouts are discussed. A number of pilot and controller reports illustrative of three typical problem types: occurrences involving pilots who have limited experience; reports describing inflight calls for assistance; and flights in which pilots have declined to use available radar services are presented. Examples of Alert Bulletins and the FAA responses to them are included. T.M.

APPLICATION OF ADVANCED TECHNOLOGIES TO SMALL, SHORT-HAUL TRANSPORT AIRCRAFT Final Report, Jun. 1979 - Jun. 1980
T. G. Coussens and R. H. Tullis. Jun. 1980. 203 p. refs.
(Contract NAS2-10264)
(NASA-CR-152363; LR-29450) Avail: NTIS HC A10/MF A01 CSCL 01C

The performance and economic benefits available by incorporation of advanced technologies into the small, short haul air transport were assessed. Low cost structure and advanced composite material, advanced turboprop engines and new propellers, advanced high lift systems and active controls; and alternate aircraft configurations with aft mounted engines were investigated. Improvements in fuel consumed and aircraft economics (acquisition cost and direct operating cost) are available by incorporating selected advanced technologies into the small, short haul aircraft. GENERAL AVIATION ACCIDENTS: POSTCRASH FIRES AND HOW TO PREVENT OR CONTROL THEM Special Study
28 Aug. 1980. 22 p. refs.
(NTSB-AAS-80-2) Avail: NTIS HC A02/MF A01

It was shown that postcrash fires occurred in approximately 8.0 percent of the 22,002 general aviation accidents during 1974-1978. About 59 percent of the accidents involving postcrash fire resulted in fatalities, while fatalities were involved in only 13.3 percent of those accidents without fire. It was demonstrated that feasible techniques for the containment of fuel exist. It was shown that fuel containment dramatically reduces fire injuries and deaths. It was shown that there are few regulations dealing with the postcrach fire problem in general aviation aircraft. Six recommendations to the Federal Aviation Administration for corrective action are given. T.M.

EVALUATION OF SAFETY PROGRAMS WITH RESPECT TO THE CAUSES OF GENERAL AVIATION ACCIDENTS: VOLUME 1: TECHNICAL REPORT
T. M. Connor and C. W. Hamilton May 1980 221 p refs
(Contract DOT-FA78WA-4159)
(AD-A087685; FAA-ASP-80-2-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 01/2

The objective of this study was to determine the extent to which the FAA safety programs were aligned with the causes of general aviation accidents. The data base used in this study consisted of a total of 30,592 general aviation accident records compiled by the National Transportation Safety Board (NTSB) from 1971 through 1977. Analysis of these records was made with respect to NTSB-cited cause/factors. FAA programs implemented during the study time period and pertaining to safety were also included in this study. GRA

AIRCRAFT CRASHWORTHINESS STUDIES: FINDINGS IN ACCIDENTS INVOLVING AN AERIAL APPLICATION AIRCRAFT
William R. Kirkham, James M. Simpson, Terry F. Wallace, and Paula M. Grape Apr. 1980 44 p refs
(AD-A084619; FAA-AM-80-3) Avail: NTIS HC A03/MF A01 CSCL 01/2

Aircraft crashworthiness features are presented. Modern aerial application aircraft are recognized as being the most crashworthy in the civil aviation fleet. Eighteen accidents involving an aerial application aircraft are presented. Crashworthiness is the protection by the aircraft against injury to the pilots from impact forces. The cockpit afforded good protection but in many of the accidents pilot restraint systems failed. There were no failures in lap belts or lap belt attachments. The structural attachment of the shoulder harness failed in a rare accident and the manufacturer strengthened the attachment. In three aircraft the inertia reel, to which the shoudler harness was attached, failed, diminishing the effectiveness of the shoudler harness in attenuating impact forces on the pilots. In 14 of the 18 accidents the seat completely or partially separated from the seat track, and in 14 accidents one or more of the cast alloy seat legs or pedestals broke. T.M.

The Articulated Total Body (ATB) model is currently being used by the AFAMRL to study the biomechanics of the pilot seat ejection from an aircraft. The new ATB-II model presented in this report incorporates features developed since the original ATB model completion and new mathematical algorithms designed to improve the usefulness and correct some of the deficiencies of the model. The new features developed for this research program are a new harness belt system, rate dependent force producing functions, arbitrary specification of the motion of multiple segments and the computation of the initial orientation from orthogonal projections of the segment axes. AIRCRAFT CRASH SURVIVAL DESIGN GUIDE. VOLUME 4: AIRCRAFT SEATS, RESTRAINTS, LITTERS, AND PADDING Final Report, Sep. 1977 - Feb. 1980
S. P. Desjardins and D. H. Laananen Jun. 1980 275 p refs Revised 5 Vol.
(Contract DAAJ02-77-C-0021; DA Proj. 1L1-62209-AH-76)
(AD-A088441; TR-7822-Vol-4; USARTL-TR-79-72D) Avail: NTIS HC A12/MF A01 CSCL 01/2

This five volume document has been assembled to assist design engineers with the development of crashworthy U.S. Army aircraft. The five volumes of the Aircraft Crash Survival Design Guide cover the following topics: Volume 1 - Design Criteria and Checklists; Volume 2 - Aircraft Crash Environment and Human Tolerance; Volume 3 - Aircraft Structural Crashworthiness; Volume 4 - Aircraft Seats, Restraints, Litters, and Padding; Volume 5 - Aircraft Postcrash Survival. This volume (Volume 4) contains information on aircraft seats, litters, personnel restraint systems, and hazards in the occupant's immediate environment. Requirements for design of seats, litters, and restraint systems are discussed, as well as design principles for meeting these requirements and testing for verification that the systems perform as desired. Energy absorbing devices for use in seat are described, as are various types of cushions. Delethalization of cockpit and cabin interiors is discussed, including the use of protective padding and the design of controls for prevention of injury. Finally, computerized methods of analysis for evaluation of seats, restraints, and the occupant's immediate environment are presented. GRA

INTERFEROMETRIC LOCATING SYSTEM Patent
Peter F. MacDoran, inventor (to NASA) (JPL) Issued 29 Jul. 1980 10 p Filed 31 Aug. 1978 Supersedes N79-10039 (17 - 01, p 0006) Sponsored by NASA
(NASA-Case-NPO-14173-1; US-Patent-4,215,345; US-Patent-Appl-SN-938581; US-Patent-Class-343-112R) Avail: US Patent and Trademark Office CSCL 17G

A system is described for determining the position of a vehicle or other target that emits radio waves and which is of the type that senses the difference in time of arrival at spaced ground stations of signals from the vehicle to locate the vehicle on a set of intersecting hyperbolas. A network of four ground stations detects the radio emissions from the vehicle and by means of cross correlation derives the relative signal delay at the ground stations from which the vehicle position is deduced. Because the signal detection is by cross correlation, no knowledge of the emission is needed, which makes even unintentional radio noise emissions usable as a locator beacon. By positioning one of the four ground stations at an elevation significantly above the plane of the other three stations, a three dimensional fix on the vehicle is possible.

AZIMUTH OBSERVABILITY ENHANCEMENT DURING INS IN-FLIGHT ALIGNMENT
Itzhack Y. Bar-Itzhack and Boaz Porat Apr. 1979 32 p refs
(TAE-362) Avail: NTIS HC A03/MF A01

The questions whether an axial acceleration maneuver is superior to a lateral one during the in flight alignment (IFA) of an inertial navigation system (INS) and whether there exists a simple test or an expression which clearly indicates it are addressed. An axial maneuver is not superior to a lateral one in general. There are, however, three classes of alignment problems in which axial maneuver is superior. These cases are modeled by simple models which yield analytic expressions clearly indicating the superiority of the axial maneuver during IFA of an INS. These three classes of alignment problems encompass a large number of existing systems. T.M.

PRELIMINARY EVALUATION OF TIME AND DISTANCE SPACING CUES USING A COCKPIT DISPLAYED TARGET

James R. Kelly. Aug. 1980. 24 p. refs.

(NASA-TM-81794) Avail: NTIS HC A03/MF A01 CSCL 17G

A simulator evaluation was conducted to compare time and distance selfspacing cues wherein a pilot establishes and maintains separation from a cockpit displayed target. Langley's terminal configured vehicle simulator which represents an advanced aircraft employing cathode ray tubes for primary flight displays and highly augmented flight control modes was used. Three tasks, two in trail rendezvous tasks (target straight and level and target turning) and one merge task were utilized. Three pilots flew each task twice, once with a time predictor cue and once with a distance predictor. Both time and distance spacing methods are operationally acceptable to the pilots. A slight preference was indicated by the pilots for the distance based predictor in performing rendezvous and merging tasks. Analysis of the recorded data showed the spacing performance with both predictors was essentially the same.

COMBINATIONS OF 148 NAVIGATION STARS AND THE STAR TRACKER

R. Duncan. Sep. 1980. 76 p. ref.

(NASA-TM-82203; JSC-16790; Rept-80-FM-43) Avail: NTIS HC A05/MF A01 CSCL 17G

The angular separation of all star combinations for 148 nav star on the onboard software for space transportation system-3 flight and following missions is presented as well as the separation of each pair that satisfies the viewing constraints of using both star trackers simultaneously. Tables show (1) shuttle star catalog 1980 star position in M 1950 coordinates; (2) two star combination of 148 nav stars; and (3) summary of two star-combinations of the star tracker 5 deg filter. These 148 stars present 10,875 combinations. For the star tracker filters of plus or minus 5 deg, there are 875 combinations. Formalhaut (nav star 26) has the best number of combinations, which is 33.

COOPERATIVE ESTIMATION OF TARGETS BY MULTIPLE AIRCRAFT. M.S. Thesis

Ralph S. Bryan. Jun. 1980. 331 p. refs.

(AD-A085799; AFIT/GE/EE/80-5) Avail: NTIS HC A15/MF A01 CSCL 17/7

A cooperative estimator of aerial target motion was designed to combine tracking information from two cooperating fighter aircraft that are tracking a single aerial target in either range and angle, or in angle only. The cooperation occurs when information, in the form of raw measurements or state estimates, is transferred between aircraft via a telemetry link. Necessary information about attackers' relative position and orientation was assumed error free, transmission delays and other details of a data link were not included, tracker errors were modeled as white noise, and timing and word length constraints of actual real time filter software were not addressed.

DISCRETE ADDRESS BEACON SYSTEM (DABS) FRONT END PROCESSOR EN ROUTE CENTRAL COMPUTER COMPLEX PROTOCOL. Final Report

11 Apr. 1980. 17 p. refs.

(AD-A085482; FAA-RD-80-37) Avail: NTIS HC A02/MF A01 CSCL 17/7

The Discrete Address Beacon System (DABS) was devloped as an evolutionary replacement for the current Air Traffic Control Radar Beacon System (ATCRBS). The DABS sensor, singly and in cooperation with other DABS sensors, provides surveillance of, and two way digital communications with aircraft equipped with DABS transponders, and provide surveillance of ATCRBS equipped aircraft. Surveillance data and data link services is provided via suitable land lines to Air Traffic Control (ATC) facilities (terminal and en route). The DABS/ATC interface consists of two digital links to each facility: a two way communications link and a one way surveillance link from sensor to ATC. The Common ICAO Data Interchange Network (CIDIN) protocol is used on the two way communications data link. When DABS is interfaced to an en route ATC facility, a special device, called the front end processor (FEP) is used to perform translation between the CIDIN protocol and the protocol used by the en route Central Computer Complex (CCC). The protocol to be used between the FEP and en Route CCC is defined.

AIRBORNE RADAR APPROACH FLIGHT TEST EVALUATING VARIOUS TRACK ORIENTATION TECHNIQUES. Final Report

Larry D. King. Jun. 1980. 195 p. refs.

(Contract DOT-FA79WA-4293)

(AD-A088426; FAA-RD-80-60) Avail: NTIS HC A09/MF A01 CSCL 17/7

This comprehensive report presents the results of a flight test experiment of an Airborne Radar Approach (ARA) System utilizing various track orientation techniques and operational modes. The tests were performed in the immediate area of NAFEC in Atlantic City, N.J. The test environment involved the airport terminal area and offshore sites. The test aircraft was a NASA CH53A helicopter manufactured by Sikorsky Aircraft and currently based at NAFEC. The test period was from January 1979 to February 1979 and from June 1979 to August 1979. Flight tests for ARA accuracy and procedures development were performed in six distinct operational modes. These were as follows: beacon w/cursor, multiple beacon, skin paint, skin paint w/cursor, combined and beacon-only modes. The specific program objectives can be summarized as follows: (1) to evaluate the ability of the

radar operator to guide an aircraft along a predetermined path using various track orientation techniques, namely: the cursor and multiple beacon techniques; (2) to assist the FAA in developing and certifying standard ARA procedures and weather minimums; (3) to define and quantify specific ARA system functions and characteristics for use in a Minimum Operational Performance Standards (MOPS) document. LORAN-BASED BUOY POSITION AUDITING SYSTEMS: ANALYTICAL EVALUATION Final Report, Feb. - Dec. 1979
Joseph A. Wolfson, Peter D. Engels, Martin C. Poppe, Jr. (Cambridge Engineering, Vt.), James M. Foltz (Analytical Sciences Corp., Reading, Mass.), and Leon M. DePalma Feb. 1980 256 p refs
(AD-A088266; TSC-USCG-80-2; USCG-D-09-80) Avail: NTIS HC A12/MF A01 CSCL 17/7

An analytic evaluation and comparison of the following candidate Buoy Position Auditing System (BPAS) configurations is presented in this report: transmission of digital Time Difference (TD) data from a Loran-C receiver on the buoy, retransmission of Loran-C pulses from the buoy, and combination of helicopter Loran-C data and helicopter to buoy microwave ranging data in a variable geometry solution. The candidate BPAS configurations utilize Loran-C in the differential mode. A model is developed to characterize differential Loran-C errors, accounting for the expected effect of the land/sea water conductivity interface. The error model is utilized alone, or with a microwave ranging system error model, to estimate buoy position fix accuracy afforded by each BPAS configuration. Accuracy estimates and data on cost, complexity, and technical risk are employed to recommend a BPAS configuration for testing. It is concluded that Loran-C pulse retransmission is not a viable BPAS configuration. The variable geometry BPAS configuration is highly accurate, due to calibration of Loran-C errors by processing of redundant data, but is not presently cost effective. The digital TD transmission BPAS configuration is recommended for testing, due to its simplicity and low cost. GRA

GPS NAVSTAR-4 AND NTS-2 LONG TERM FREQUENCY STABILITY AND TIME TRANSFER ANALYSIS Interim Report
J. A. Buisson, T. B. McCaskill, O. J. Oaks, M. M. Largay, and S. B. Stebbins 30 Jun. 1980 32 p refs
(AD-A088092; NRL-8419) Avail: NTIS HC A03/MF A01 CSCL 17/7

Since the launch of the first Navigation Technology Satellite (NTS) in 1974, international time transfer experiments have been performed as part of the concept validation phase of the Global Positioning System (GPS). Time transfer results from both NTS-1 and NTS-2 are presented, including recent measurements from receivers located in South America, Germany, Japan, and the United States. A time link to the DOD Master clock allows submicrosecond intercomparison of UTS (USNO, MC1) with clocks in the respective countries via the NTS link. Work is progressing toward a retrofit conversion of existing NTS receivers (located at NASA and foreign observatories) into GPS time transfer receivers. Initial results are presented on the long term rubidium frequency stability as measured from the GPS NAVSTAR-4 space vehicle (SV). Analysis has been performed for sample times varying from 1 to 10 days. Using a 154 day data span starting on day 36, 1979, data was collected from the four GPS monitor stations located at Vandenberg, Guam, Alaska, and Hawaii. A time domain estimate for the NAVSTAR-4 SV clock offset is obtained for each SV pass over the GPS monitor sites, using a smoothed reference ephemeris, with corrections for ionospheric delay, tropospheric delay, earth rotation, and relativistic effects. Conversion from the time domain to the frequency domain is made using the two sample Allan Variance, sigma tau plots are used to identify the noise processes. Estimates of flicker and white frequency noise for the NAVSTAR-4 rubidium frequency standard are obtained. GRA

ALTERNATE WAVEFORMS FOR A LOW-COST CIVIL GLOBAL POSITIONING SYSTEM RECEIVER Final Report, Aug. 1979 - Apr. 1980
Herman F. Vandevenne and Edward J. Kelly Jun. 1980 128 p refs
(Contract DOT-TSC-RA-78-06)
(AD-A088345; ATC-86; FAA-EM-79-16; TSC-FAA-79-24) Avail: NTIS HC A07/MF A01 CSCL 17/7

This report examines the technical feasibility of alternate waveforms to perform the GPS functions and to result in less complex receivers than is possible with the GPS C/A waveform. The approach taken to accomplish this objective is (a) to identify, after a quick broad overview, a few promising waveforms, (b) to complete the architectural synthesis of a GPS system based on the new waveforms, (c) to analyze the performance of these systems in providing ranging and communication capability and (d) to assess the impact on receiver hardware and software. One conclusion is that the class of pulsed waveform, when combined with emerging matched filter technology, permits the use of a greatly simplified receiver design. A major part of the report consists of description of a pulse based GPS design. Although very specific, the design was intended as a vehicle for performance analysis only and many refinements and alternatives within the same class are possible. Other classes of waveforms such as tone ranging and chirped FM waveforms, although adequate, do not seem superior to the present PN encoded CW waveform for GPS. Finally, if the 'alternate' waveform is simply the present C/A waveform but with a substantially increased power level, it is shown that with the present designs the performance will be greatly increased or, alternatively, performance margin can be traded for a simplified receiver implementation. INITIAL DATA BANK REPORT: FALL 1978; WINTER, SPRING, SUMMER, FALL 1979, WINTER 1980 Data Report, 1978 - 1980
Lorraine I. Rzonca Jul. 1980 22 p
(AD-A088204; FAA-CT-80-189; FAA-RD-80-83) Avail: NTIS HC A02/MF A01 CSCL 17/7

The International Bank for airborne Omega data has begun operation at the Federal Aviation Administration (FAA) Technical Center. This first report issued by the Data Bank is based upon preliminary data for Pacific flights in fall 1978 and winter/spring 1979 and upon data from North Atlantic flights in summer/fall 1979 and winter 1980. At least three Omega stations were received during all phases of these flights. No significant seasonal variations or effects due to solar activity were noted in the signal to noise values. These values were highly repeatable (under the same conditions) with major drops due to ice cap attenuation and operation in areas of normally high very low frequency (VLF) noise. Differences in signal to noise between signals traversing daylight/night ice cap (for both Greenland and Antarctica) were noted. GRA

(Contract DAAJ02-77-C-0061; DA Proj. 1L2-62209-AH-76)
(AD-A077373; SER-510016; USARTL-TR-79-18) Avail: NTIS HC A11/MF A01 CSCL 01/3

In service experience with helicopter airframe structures, particularly bonded structures and composite materials was surveyed. Laboratory testing was conducted to assess the damage tolerance of several composites in both monolithic and sandwich construction, and to test the effectiveness of simple field type repairs. A method was developed to assess and rank the R&M characteristics of advanced composite structures designs. The method involves a systematic evaluation of the many variables affecting the reliability and maintainability of helicopter airframe structures. Damage potential, damage tolerance, repairability and replaceability are among the key factors evaluated. The product of this analysis is a qualitative rating of structural reliability, hardware reliability and maintainability. Sensitivity studies indicate that advanced composites can be cost effective and that the life cycle costs are dominated by the initial cost of manufacture and by the structural reliability of the design. The R&M and cost characteristics of four advanced composites concepts, representing a cross section of helicopter airframe structures, were analyzed. A.R.H.

APPLICATIONS OF ADVANCED ELECTRIC/ELECTRONIC TECHNOLOGY TO CONVENTIONAL AIRCRAFT Final Report, Jul. 1979 - Aug. 1980
R. L. Heimbold Jul. 1980 277 p refs
(Contract NAS9-15863)
(NASA-CR-163576; LR-29520) Avail: NTIS HC A13/MF A01 CSCL 01C

The desirability of seven advanced technologies as applied to three commercial aircraft of 1985 to 1995 was investigated. Digital fly by wire, multiplexing, ring laser gyro, integrated avionics, all electric airplane, electric load management, and fiber optics were considered for 500 passenger, 50 passenger, and 30 passenger aircraft. The major figure of merit used was Net Value of Technology based on procurement and operating cost over the life of the aircraft. An existing computer program, ASSET, was used to resize the aircraft and evalute fuel usage and maintenance costs for each candidate configuration. Conclusions were that, for the 500 passenger aircraft, all candidates had a worthwhile payoff with the all electric airplane having a large payoff. L.F.M.

ENGINE BLEED AIR REDUCTION IN DC-10
W. H. Newman and M. R. Viele Sep. 1980 75 p refs
(Contract NAS3-21763)
(NASA-CR-159846) Avail: NTIS HC A04/MF A01 CSCL 01C

An 0.8 percent fuel savings was achieved by a reduction in engine bleed air through the use of cabin air recirculation. The recirculation system was evaluated in revenue service on a DC-10. The cabin remained comfortable with reductions in cabin fresh air (engine bleed air) as much as 50 percent. Flight test verified the predicted fuel saving of 0.8 percent. R.C.T.

IMPROVED TEST METHODS FOR DETERMINING LIGHTNING-INDUCED VOLTAGES IN AIRCRAFT Final Report
K. E. Crouch and J. A. Plumer Sep. 1980 106 p refs
(Contract NAS4-2613)
(NASA-CR-3329; LT-80-59) Avail: NTIS HC A06/MF A01 CSCL 01C

A lumped parameter transmission line with a surge impedance matching that of the aircraft and its return lines was evaluated as a replacement for earlier current generators. Various test circuit parameters were evaluated using a 1/10 scale relative geometric model. Induced voltage response was evaluated by taking measurements on the NASA-Dryden Digital Fly by Wire F-8 aircraft. Return conductor arrangements as well as other circuit changes were also evaluated, with all induced voltage measurements being made on the same circuit for comparison purposes. The lumped parameter transmission line generates a concave front current wave with the peak di/dt near the peak of the current wave which is more representative of lightning. However, the induced voltage measurements when scaled by appropriate scale factors (peak current or di/dt) resulting from both techniques yield comparable results. L.F.M.

CONCEPTUAL STUDY OF MODIFYING AN EXISTING FIGHTER FOR V/STOL CAPABILITY AND COMBAT MANEUVERING ENHANCEMENT Final Report
Richard E. Kuhn Jul. 1980 59 p refs
(Contract N00167-80-M-0844)
(AD-A087657; DTNSRDC-80/088;
DTNSRDC/ASED-AERO-1269) Avail: NTIS HC A04/MF A01 CSCL 01/3

The possibility of modifying an existing fighter aircraft to give it V/STOL capability and of incorporating a V/STOL control system that could also be used in conventional flight to improve the aircraft's combat maneuverability is examined. The study indicates that the F-18 could be given a V/STOL capability using either the lift plus lift-cruise or the vertical attitude take off and landing (VATOL) concept. The lift-cruise plus remote burner concept does not appear to be compatible with the F-18 airframe. The ADEN nozzle concept currently under development, with some modification, could be used on either the lift plus lift-cruise or the VATOL concepts to vector the cruise engine thrust and thereby augment the conventional controls for improved high angle of attack combat maneuverability. TRANSONIC PITCH DAMPING OF A DELTA WING AIRCRAFT DETERMINED FROM FLIGHT MEASUREMENTS
R. A. Feik Jul. 1979 30 p refs
(AD-A087771; ARL/AERO-TM-153) Avail: NTIS HC A03/MF A01 CSCL 20/4

A flight investigation aimed mainly at determining the pitch damping of a 60 degree Delta wing aircraft between M 0.7 and M - 1.2 has been undertaken. Flight tests were conducted by ARDU and the measurements obtained have been successfully

analysed at ARL using a modified Newton-Raphson parameter estimation procedure. The results for pitch damping as well as other longitudinal aerodynamic derivatives have been compared with wind tunnel and/or theoretical estimates. Further information has also been gained relating to the necessary conditions for successful extraction of parameters from flight data. The parameter estimation procedure has proved to be an effective analysis method even when only a modest amount of flight data, obtained using a relatively simple instrumentation package, has been available. DEVELOPMENT OF HIGH LIFT DEVICES FOR APPLICATION TO ADVANCED NAVY AIRCRAFT Final Report
James H. Nichols, Jr. Apr. 1980 47 p ref Presented at the Workshop on V/STOL Aerodyn., Monterey, Calif., 16-18 May 1979
(WF41421091)
(AD-A084226; DTNSRDC-80/058; DTNSRDC/AERO-1266) Avail: NTIS HC A03/MF A01 CSCL 01/3

A number of methods for generating high lift to provide a short takeoff and landing (STOL) capability for advanced Navy aircraft are evaluated with emphasis on low aspect ratio wings. Upper surface blowing, circulation control wing, and wing tip sails are given the most attention. Experimental data were obtained in the wind tunnels on these concepts as specifically applied to wings of aspect ratios 3 to 5. Flight demonstrations of a circulation control wing application to the A-6 aircraft showed the ability to more than double the lifting capability which resulted in landing speed reductions of more than 30 percent, landing ground roll reductions of more than 50 percent, and takeoff distance reductions of at least 25 percent. The experimental high lift system data was applied to a conceptual STOL baseline aircraft in order to estimate the impact on mission performance and identify their various merits as applicable to the particular restrictions of small ship operations. COMPUTATIONAL AND SIMPLIFIED ANALYTICAL TREATMENT OF TRANSONIC WING-FUSELAGE-PYLON-STORE INTERACTIONS Final Technical Report, 1 Jul. 1978 - 31 Dec. 1979
Vijaya Shankar and Norman D. Malmuth 25 Apr. 1980 17 p refs Presented at the AIAA 18th Aerospace Sci. Meeting, Pasadena, Calif., 14-16 Jan. 1980
(Contract N00014-78-C-0477; NR Proj. 212-257)
(AD-A085619; ONR-CR-212-257-IF; SC5172.10TR) Avail: NTIS HC A02/MF A01 CSCL 01/3

Transonic modified small disturbance theory was employed to numerically model the flow field around wing-fuselage-pylon-store configurations. A fine grid region enclosing the wing-pylon-store was embedded within a global crude grid and a successive crude-fine relaxation was performed. With a simple image point concept, the store and the pylon were introduced into an existing wing fuselage program thus avoiding excessive additional computer memory requirements. Comparison on results with experiments for the F-5 wing with a pylon-store arrangement is presented. A study of the roles of pylon height, store diameter, pylon span mount location, angle of attack and Mach number relative to the achievement of optimum L/D from beneficial nonlinear interference is presented. A simplified analytical approach to compute the loading on the store using an immersion theory is indicated and validated against experiments. T.M.

DESIGN AND ANALYSIS OF CH-47 EXTERNAL CARGO HANDLING SYSTEM (SNUBBED LOAD) Final Report, Sep. 1977 - Oct. 1979
Theodore S. Garnett, Jr., Richard F. Campbell, and David J. Hodder Oct. 1979 445 p refs
(Contract DAAJ02-77-C 0069)
(AD-A088057; D210-11555-1) Avail: NTIS HC A19/MF A01 CSCL 01/3

Development of a preliminary design concept to snub containerized external cargo loads to the CH-47 aircraft, for improved terrain and Night/IMC flight capability, has been completed. Results are suitable for detail design implementations leading to prototype demonstration of the system in the future. The External Cargo Handling System (ECHS) snubs loads (of up to 25,000 lbs. weight) against the helicopter landing gear, using a self hoisting adapter framework powered by 6 horsepower tandem electric hoists installed of nonlinear vibration isolation mounts to interface the load with the aircraft. The ECHS snubbing adapter uses guide arms for load acquisition assistance, and twistlocks to lock the load to the adapter. No structural modification to the CH-47 is required. Compared to carrying cargo on conventional external sling suspension with a CLAH adapter, load snubbing provides a substantial performance benefit for terrain flight missions; and at the same time improves both masking and maneuverability along with capability for flight at night, or in IMC condition. MANUFACTURING PROCESS DEVELOPMENT FOR DUST AND RAIN EROSION RESISTANT COATED METALLIC CLADS FOR HELICOPTER ROTORS Final Report, 5 Apr. 1976 - 30 Jul. 1980
David P. Huey and Alvin R. Stetson Jun. 1980 184 p refs
(Contract DAAG46-76-C-0033)
(AD-A088440; SR80-R-4511-37) Avail: NTIS HC A09/MF A01 CSCL 13/8

Manufacturing processes for creating erosion resistant coatings on metallic rotor blade leading edges were optimized as a follow on to a coating development program sponsored by AMMRC (Contract DAAG74-C-0054). Solide coated, titanium rotor nose caps were produced in sections up to 30 inches long. Commercially pure (A75) and alloyed (Ti-6Al-4V) titanium was used. Newly developed graphite coating mandrels made possible simultaneous coating and creep forming of titanium sheet material to accurate airfoil contours. Sand and rain erosion tests were performed along with tensile, impact, salt spray and adhesive bonding tests. Costs per part for production quantities were estimated. Solide coated test specimens of titanium and SAE 430 stainless steel were provided to three major helicopter manufacturers for test and evaluation: Hughes, Sikorsky and Bell. Their conclusions were that Solide coatings are excellent in rain erosion resistance and low angle sand erosion resistance but do not meet minimum survival requirements when subjected to sand erosion by large particles (greater than 100 micrometer) impinging at high angles (greater than 45 degrees). Avail: NTIS HC A07/MF A01 CSCL 01/3

A computer program for evaluating helicopter performance in accelerated flight has been developed. The program was designed to permit analysis of any definable single rotor helicopter. Provisions for partial or total power loss at any point along the flight path are included. To accommodate emergency conditions provisions are made for evaluation of auxiliary power devices, tip rockets, JATO, RATO, fly wheels, drag brakes, and dropping of external loads. Optimization routines for establishing height velocity envelopes are also included. The program is linked with a plot package which provides 40 prime output variables to be plotted. A perspective view of the flight path and plots of height velocity diagrams are also available. This volume covers the engineering aspects of the program. Volume 2 presents the User's Manual. GRA

HELICOPTER DYNAMIC PERFORMANCE PROGRAM. VOLUME 2: USER'S MANUAL Final Report
R. E. Studwell Jul. 1980 101 p
(Contract DAAJ02-76-C-0066; DA Proj. 1F2-62209-AH-76)
(AD-A088318; USARTL-TR-79-27-B-Vol-2; SER-510011-Vol-2) Avail: NTIS HC A06/MF A01 CSCL 01/3

The program provides a means of rapidly estimating rotorcraft takeoff and landing capabilities from or to any given heliport size or location. Proper application of the instructions outlined

herein for computing opertional capabilities and flight procedures can minimize the risk and cost of testing rotorcraft capabilities in the takeoff, landing and emergency of flight. The program has been written in FORTRAN IV and designed primarily for interactive operation on the IBM 360/65 computer system, in conjunction with a PDP-11 and DEC-GT-40 scope and a Houston bed type plotter. Interfacing with a Tektronix storage tube Model 4010, 4012, or 4014, the Houston plot bed and the IBM 360/65 is also available. Options for batch processing with and without Houston plots has been provided. With minor modifications the program can also be interfaced with a CDC or UNIVAC 1110 in lieu of the IBM 360/65. Program modifications required for CDC 6600 compatibility are covered in Section 9 of this report. GRA

INTEGRAL AIRCRAFT FUEL TANK LEAK CLASSIFICATION
Interim Technical Report, 1 Sep. 1978 - 15 Apr. 1979
Leo Parts, Thomas J. Bucher, Benito P. Botteri (AFAPL, Wright-Patterson AFB, Ohio), and Robert E. Cretcher (AFAPL, Wright-Patterson AFB, Ohio) Jan. 1980 193 p refs
(Contract F33615-78-C-2023; AF Proj. 3048)
(AD-A088168; MRC-DA-894; AFAPL-TR-79-2992) Avail: NTIS HC A09/MF A01 CSCL 01/2

A parametric study has been conducted to investigate external leakage from aircraft integral fuel tanks. The effects of the following parameters on the rate of surface dispersion of fuels were examined: fuel type, leakage rate, surface material, fuel and surface temperature, air flow rate over the test surface, and surface angle of inclination. The dispersing fuel films were found to be very thin (0.05 mm/0.002 in.); i.e., limited liquid volume flow results in extensive surface coverage. Fuels of low volatility such as JP-5 and JP-8 dispersed at a faster rate over the surface and exhibited a greater propensity for dripping than those of high volatility (AvGas and JP-4). Low temperatures, inclined surfaces, and polyurethane latex surface coating enhanced fuel dripping from the test surface. Fuel flow rates required to support sustained burning at the leakage site were investigated with JP-4, JP-5, JP-8, JP-4/JP-8 mixtures, and AvGas. The measurements were conducted at temperatures ranging from 3.3 C to 98 C (38 F to 209 F). The vapor pressure of the fuel at the test temperature has a very pronounced effect on the propensity of the leaking fuel to sustain burning. The minimum volume flow rates required for sustained burning ranged from 0.2 ml/min (AvGas at 23 C (73 F)) to 9 ml/min. (JP-5 at 98 C (208 F)). GRA

USE OF NOSE CAP AND FUSELAGE PRESSURE ORIFICES FOR DETERMINATION OF AIR DATA FOR SPACE SHUTTLE ORBITER BELOW SUPERSONIC SPEEDS
Terry J. Larson and Paul M. Siemers, III (NASA, Langley Research Center) Sep. 1980 128 p refs
(NASA-TP-1643; H-1096) Avail: NTIS HC A07/MF A01 CSCL 01D

Wind tunnel pressure measurements were acquired from orifices on a 0.1 scale forebody model of the space shuttle orbiter that were arranged in a preliminary configuration of the shuttle entry air data system (SEADS). Pressures from those and auxiliary orifices were evaluated for their ability to provide air data at subsonic and transonic speeds. The orifices were on the vehicle's nose cap and on the sides of the forebody forward of the cabin. The investigation covered a Mach number range of 0.25 to 1.40 and an angle of attack range from 4 deg. to 18 deg. An air data system consisting of nose cap and forebody fuselage orifices constitutes a complete and accurate air data system at subsonic and transonic speeds. For Mach numbers less than 0.80 orifices confined to the nose cap can be used as a complete and accurate air data system. Air data systems that use only flush pressure orifices can be used to determine basic air data on other aircraft at subsonic and transonic speeds. T.M.

HELICOPTER ELECTRO-OPTICAL SYSTEM DISPLAY REQUIREMENTS. 3: THE EFFECTS OF CRT DISPLAY SIZE AND LUMINANCE ON DARK ADAPTATION OF HELICOPTER PILOTS
Richard M. Johnson, Aaron Hyman, and Paul A. Gade Mar. 1980 18 p refs
(DA Proj. 2Q1-62722-A-765)
(AD-A088527; ARI-TR-443) Avail: NTIS HC A02/MF A01 CSCL 05/8

Previous research has indicated that pilots may be able to successfully use a television display of low luminance level as an aid to nighttime nap-of-the-Earth helicopter flight. This experiment was conducted to assess the effects of display luminance level and display size on pilots' visual dark adaptation. Brightness matches made by 12 Army helicopter pilots were used to determine the magnitude of the dark-adaptation loss that resulted from viewing a 13 cm and a 26 cm CRT display at relatively bright and dim luminance levels. In the procedure used, one eye was light adapted to the CRT panel display while the other eye remained dark adapted. Then, while the pilots viewed a simulated windscreen display, the luminance setting for the dark-adapted eye was adjusted independently until the display appeared equally bright to both eyes. Windscreen display luminance for the previously light-adapted eye remained fixed at a highlight brightness of 0.01 footlambert (equivalent to full Moon illumination). The larger display was judged to produce the greater dark-adaptation loss, even though the larger display could be successfully used at a lower luminance level. This result might have been due the the greater involvement of the peripheral rod retinal receptor cells when pilots made judgments following exposure to the larger light-adapting display. In such a case, selective attenuation of the blue end of the spectral energy output from the CRT phosphor could reduce the magnitude within 1 second after light adaptation to a dim 26 cm television display showed a 67% loss in the apparent brightness of the windscreen display. This is equivalent to flying under one-third full moon conditions. GRA

07 AIRCRAFT PROPULSION AND POWER

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

MULTIPLE PURE TONE ELIMINATION STRUT ASSEMBLY Patent Application
Frank W. Burcham, Jr., inventor (to NASA) Filed 11 Sep. 1980 9 p
(NASA-Case-FRC-11062-1; US-Patent-Appl-SN-185869) Avail: NTIS HC A02/MF A01 CSCL 21E

An acoustic noise elimination assembly is described which has a capability for disrupting the continuity of fields of sound pressures forwardly projected from fans or rotors of a type commonly found in the fan or compressor first stage for airbreathing engines when operating at top speeds in the supersonic range. The assembly includes a tubular cowl defining a duct for delivering an airstream axially into the intake for a jet engine and a sound barrier defined by a plurality of intersecting flat plates or struts, having a line of intersection coincident with a longitudinal axis of the tubular cowl which serves to disrupt the continuity of rotating fields of multiple pure tonal components of noise. LOW-PRESSURE PERFORMANCE OF ANNULAR, HIGH-PRESSURE (40 ATM) HIGH-TEMPERATURE (2480 K) COMBUSTION SYSTEM
Jerrold D. Wear Washington Sep. 1980 20 p refs
(NASA-TP-1713; E-372) Avail: NTIS HC A02/MF A01 CSCL 21E

Experimental tests were conducted to develop a combustion system for a 40 atmosphere pressure, 2480 K exhaust gas temperature, turbine cooling facility. The tests were conducted in an existing facility with a maximum pressure capability of 10 atmospheres and where inlet air temperatures as high as 894 K could be attained. Exhaust gas temperatures were as high as 2365 K. Combustion efficiences were about 100 percent over a fuel air ratio range of 0.016 to 0.056. Combustion efficiency decreased at leaner and richer ratios when the inlet air temperature was 589 K. Data are presented that show the effect of fuel air ratio and inlet air temperature on liner metal temperature. Isothermal system pressure loss as a function of diffuser inlet Mach number is also presented. Data included exhaust gas pattern factors; unburned hydrocarbon, carbon monoxide, and oxides of nitrogen emission index values; and smoke numbers. Author

INVESTIGATION OF PERFORMANCE, NOISE, AND DETECTABILITY CHARACTERISTICS OF REMOTELY PILOTED VEHICLE (RPV) PROPELLERS Final Report
D. S. Janaki Ram Jun. 1980 168 p refs
(Contract DAAJ02-77-C-0029)
(AD-A088325; RASA/SRL-14-79-05; USAAVRADCOM-TR-80-D-7) Avail: NTIS HC A08/MF A01 CSCL 01/3

Several small scale propeller configurations applicable to a conceptual Remotely Piloted Vehicle (RPV) aircraft were designed, fabricated, and tested to determine their performance, acoustic, and detectability characteristics. The tests were conducted in static and simulated forward flight conditions in a wind tunnel. Propellers tested included tractor, pusher, and ducted configurations. The acoustic data obtained were used to determine the slant range and altitude of no detection of each propeller configuration. The data were analyzed to determine the effects of blade number, blade design (activity factor and twist), diameter, tip speed, thrust, and forward velocity on the acoustic and detectability characteristics of the propeller configurations tested. The performance data did not show any conclusive trends except that the ducted and pusher propeller configurations tested were less efficient than their open and tractor counterparts respectively. UNSTEADY TRANSONIC FLOWS IN A TWO-DIMENSIONAL DIFFUSER Annual Report, 1 Apr. 1979 - 31 Mar. 1980
Miklos Sajben, Thomas J. Bogar, and Joseph C. Kroutil May 1980 30 p refs
(Contract F49620-77-C-0082; AF Proj. 2307)
(AD-A088231; AFOSR-80-0628TR) Avail: NTIS HC A03/MF A01 CSCL 21/5

Extensive measurements of shock position and pressure distributions (wall static, core flow static, and core flow total) were made, complemented by spark schlieren and high speed schlieren photographic information. Measurements were made at shock Mach numbers up to 1.35, with and without excitation. The excitation amplitudes were low, with frequencies from 0 to 330 Hz. Unexcited flows displayed two dominant natural frequencies for attached flows (shock Mach numbers below 1.27) and one dominant peak for separated flows (shock Mach numbers above 1.28). The dominant frequencies depend strongly on shock strength. Diffuser response to excitation appears to follow patterns expected on the basis of low amplitude (acoustic) wave propagation concepts, provided that the stream wise variation of the flow speed is considered and realistic boundary conditions are applied at the ends of the channel. The study strongly suggests that the effective acoustic impedance associated with the shock/boundary layer interaction zone is an important determinant of diffuser response to small amplitude external perturbations. HANDLING QUALITIES OF LARGE FLEXIBLE AIRCRAFT Ph.D. Thesis
Supat Poopaka Dec. 1980 72 p
(Grant NsG-4018)
(NASA-CR-163593) Avail: NTIS HC A04/MF A01 CSCL 01C

The effects on handling qualities of elastic modes interaction with the rigid body dynamics of a large flexible aircraft are studied by a mathematical computer simulation. An analytical method to predict the pilot ratings when there is a severe modes interactions is developed. This is done by extending the optimal control model of the human pilot response to include the mode decomposition mechanism into the model. The handling qualities are determined for a longitudinal tracking task using a large flexible aircraft with parametric variations in the undamped natural frequencies of the two lowest frequency, symmetric elastic modes made to induce varying amounts of mode interaction. R.C.T.

09 RESEARCH AND SUPPORT FACILITIES (AIR)

MODELING AND CONTROL OF TRANSONIC CRYOGENIC WIND TUNNELS Final Summary Report, period ending Oct. 1980
S. Balakrishna and A. Tennille, ed. Oct. 1980 53 p refs
(Grant NsG-1503)
(NASA-CR-163588) Avail: NTIS HC A04/MF A01 CSCL 14B

The problem of automatic control of fan driven closed circuit, transonic, cryogenic tunnels, which use gaseous nitrogen as the test medium and sprayed liquid nitrogen as the coolant was investigated. Operation of the tunnel gas of a wind tunnel at cryogenic temperatures yielded considerable enhancement of flow Reynolds number. This property was successfully exploited in realizing free flight equivalent flow Reynolds numbers on relatively small models. This quantum improvement in Reynolds number capability was demonstrated by the successful operation of the 0.3 meter Transonic Cryogenic Tunnel (0.3 m TCT). The initial operation of the 0.3 m TCT was by manual manipulation of the tunnel control inputs: liquid nitrogen flow into the tunnel by a valve, gaseous nitrogen flow out of the tunnel by a valve, and the fan speed. The operating experience indicated a highly coupled process which tended to creep away from equilibrium. This pointed to a need for automatic control of the cryogenic tunnel. T.M.

LASER ANGLE MEASUREMENT SYSTEM Final Report
C. R. Pond, P. D. Teixeira, and R. E. Wilbert Oct. 1980 51 p
(Contract NAS1-15410)
(NASA-CR-159306; D180-25234-1) Avail: NTIS HC A04/MF A01 CSCL 14B

The design and fabrication of a laser angle measurement system is described. The instrument is a fringe counting interferometer that monitors the pitch attitude of a model in a wind tunnel. A laser source and detector are mounted above the mode. Interference fringes are generated by a small passive element on the model. The fringe count is accumulated and

displayed by a processor in the wind tunnel control room. Optical and electrical schematics, system maintenance and operation procedures are included, and the results of a demonstration test are given. R.C.T.

DESIGN CONCEPT FOR FUEL FIRE FACILITY SCALE-DOWN Final Report
John R. Piergallini. Aug. 1979. 58 p. refs.
(WF51523000)
(AD-A084624; NADC-79227-60) Avail: NTIS HC A04/MF A01 CSCL 14/2

An all-weather, self-sustaining, indoor fuel-fire facility for the generation of data for the evaluation of burn-protective capacity of personal gear for naval aircrewmen and flight deck personnel in full-scale fuel fire exposures was developed. A scaled-down indoor version of the existing fuel-fire facility provided realistic data for protective-capacity analysis. An automated enclosed facility allows experiments to be conducted efficiently indoors in a closely controlled environment with minimal risk to personnel and surrounding and with more timely and consistent results in the analysis of data for burn protection of naval aircrewmen. POTENTIAL PROBLEMS RELATIVE TO TDRS/IUS TILT TABLE ELEVATION WITH FAILED VRCS
Jerome Bell. Sep. 1980. 29 p.
(NASA-TM-82201; JSC-16870; IN-80-FM-50) Avail: NTIS HC A03/MF A01 CSCL 22A

Operational concerns and preliminary solution alternatives related to elevating the inertial upper stage/tracking and data relay satellite (IUS/TDRS) with a failed orbiter vernier reaction control system (VRCS) are presented. Problems arise from the combination of TDRS thermal constraints and tilt table constraints (the primary reaction control system (PRCS) cannot be used to hold attitude while the tilt table is being elevated), and the problems are compounded by the minimum PRCS attitude deadband. The potential solution options are affected by the launch window, flight profile, crew procedures, vehicle capability and constraints, and flight rules. T.M.

COMPARATIVE THERMAL ANALYSIS OF ALTERNATE CRYOGENIC FLUID MANAGEMENT EXPERIMENT (CFME) CONFIGURATIONS
F. Merino and R. F. O'Neill. Jul. 1980. 66 p. refs.
(Contract NAS3-21935)
(NASA-CR-165151; GDC-CRAD-80-014) Avail: NTIS HC A04/MF A01 CSCL 22A

The Cryogenic Fluid Management Experiment (CFME) was analyzed to assess the feasibility and advisability of deleting the vapor cooled shield (VCS) from the baseline CFME insulation and pressure control system. Two alternate concepts of CFME insulation and pressure control, neither of which incorporated the VCS, were investigated. The first concept employed a thermodynamic vent system (TVS) to throttle the flow through an internal wall mounted heat exchanger (HX) within the pressure vessel to decrease boiloff and pressure rise rate, while the second concept utilized a TVS without an internal heat exchanger. Only the first concept was viable. Its performance was assessed for a seven day mission and found to be satisfactory. It was also concluded that VCS development costs would be greater than for an internal HX installation. Based upon the above comparisons, the HX was recommended as a replacement for the VCS. A.R.H.

A STUDY ON VARIOUS METHODS OF SUPPLYING PROPELLANT TO AN ORBIT INSERTION ROCKET ENGINE Final Technical Report
John E. Boretz, Sam Hunu, Matt Thompson, Mike Pagani, Bob Paulsen, Joe Lewis, and Don Paul. 9 May 1980. 170 p. refs.
(Contracts NAS7-100; JPL-955656)
(TRW/DSSG-36358.001; NASA-CR-163587; JPL-9950-415)
Avail: NTIS HC A08/MF A01 CSCL 22A

Various types of pumps and pump drives were evaluated to

determine the lightest weight system for suppplying propellants to a planetary orbit insertion rocket engine. From these analyses four candidate propellant feed systems were identified. Systems Nos. 1 and 2 were both battery powered (lithium-thionyl-chloride or silver-zinc) motor driven pumps. System 3 was a monopropellant gas generator powered turbopump. System 4 was a bipropellant gas generator powered turbopump. Parameters considered were pump breake horsepower, weight, reliability, transient response and system stability. Figures of merit were established and the ranking of the candidate systems was determined. Conceptual designs were prepared for typical motor driven pumps and turbopump configurations for a 1000 lbf thrust rocket engine.

TITAN PROBE TECHNOLOGY ASSESSMENT AND TECHNOLOGY DEVELOPMENT PLAN STUDY Final Report
Angelo J. Castro Jul. 1980 191 p refs
(Contract NAS2-10380)
(NASA-CR-152381; TPT-MA-02-3) Avail: NTIS HC A09/MF A01 CSCL 22B
The need for technology advances to accomplish the Titan probe mission was determined by defining mission conditions and requirements and evaluating the technology impact on the baseline probe configuration. Mission characteristics found to be technology drivers include (1) ten years dormant life in space vacuum; (2) unknown surface conditions, various sample materials, and a surface temperature; and (3) mission constraints of the Saturn Orbiter Dual Probe mission regarding weight allocation. The following areas were identified for further development: surface sample acquisition system; battery powered system; nonmetallic materials; magnetic bubble memory devices, and the landing system. Preentry science, reliability, and weight reduction and redundancy must also be considered.

FILTER DEVELOPMENT FOR THE EXTREME ULTRAVIOLET EXPLORER Final Report, 10 Jul. 1977 - 30 Jun. 1980
Randy Kimble and Patrick Jelinsky 30 Jun. 1980 22 p
(Contract NAS5-24189)
(NASA-CR-160039) Avail: NTIS HC A02/MF A01 CSCL 22B
Thin film filters with extreme ultraviolet bandpasses unattainable with previously available filter materials were developed. Titanium and antimomy were identified as the most promising materials for providing the scientifically important 350-500 A bandpass heretofore unattainable with thin film filters. Titanium foils and titanium-antimony sandwich foils of the required uniformity and durability were fabricated. Transmission measurements and optimization studies indicate that the titanium-antimony combination provides an ideal bandpass for scientifically valuable, high-sensitivity observations with EUVE. Environmental testing of the mechanical strength, moisture sensitivity and aging characteristics of the newly developed filter materials demonstrate flightworthy performance.

The feasibility of conductive adhesive techniques for the electrical interconnection of ITO-coated second surface mirrors has been studied. The good electrostatic performance and the durability of components combining ITO coated aluminized Kapton and aluminum straps by means of a silver loaded silicone have been confirmed by a prequalification program. The charge dissipation mechanisms for silica fabrics in a geosynchronous magnetic substorm environment have been studied by means of various sample configurations that have been tested under electron beam. Some recommendations have been given for a better use of silica fabrics as thermal control coatings in space. GRA

GUIDANCE AND CONTROL OF TACTICAL MISSILES M.S. Thesis
Thomas Alan Grote Dec. 1979 174 p refs
(AD-A085147) Avail: NTIS HC A08/MF A01 CSCL 16/2

The functioning program used to investigate the impact miss distance for the Supersonic Tactical Missile was modified. When the initial y-displacement error exceeded 1800 feet, the missile did not acquire the target. All errors smaller than this resulted in miss distances within 0.5 feet of the target. The midcourse guidance reference altitude was changed to reflect a sea-skimming missile. This simulation ran and impact was recorded. An attempt at adding random noise to the homing seeker was tried, but revealed that more information is required on this topic. The computer program was successfully converted and altered to run using the simplified ramjet model. T.M.

MODELLING OF ENVIRONMENTALLY INDUCED DISCHARGES IN GEOSYNCHRONOUS SATELLITES
N. John Stevens 1980 9 p refs Presented at the Ann. Conf. on Nucl. and Space Radiation Effects, Ithaca, N.Y., 15-18 Jul. 1980; sponsored by IEEE
(NASA-TM-81598; E-581) Avail: NTIS HC A02/MF A01 CSCL 22B

The NASCAP computer code was used to compute the charging and discharging characteristics of a typical communications satellite in geosynchronous orbit. For the case of a severe substorm satellite surface differential charging in sunlight was found to be substantially less than that required to produce discharges in ground simulation studies. A discharge process was postulated involving discharges triggered at edges (or imperfection) followed by discharges to space. The characteristics of such discharges was parametrically varied to evaluate the possible effects on the satellite. Results indicated that discharge characteristics inferred from satellite monitors could be caused by predicted space discharges, that single cell discharges to space can reduce surface potentially over entire satellite, and that low density electron trajectory computations indicate that discharge generated electrons do not return to the satellite by long trajectories. Current transients predicted do not agree with available ground simulation results indicating that additional work must be done both analytically and experimentally to understand and fully explain these discrepancies. R.C.T.

FEASIBILITY OF MODIFYING THE HIGH RESOLUTION INFRARED RADIATION SOUNDER (HIRS/2) FOR MEASURING SPECTRAL COMPONENTS OF EARTH RADIATION BUDGET Final Report
Edward W. Koenig and Kent A. Holman Aug. 1980 80 p
(Contract NAS1-16180)
(NASA-CR-159353) Avail: NTIS HC A05/MF A01 CSCL 14B

The concept of adding four spectral channels to the 20 channel HIRS/2 instrument for the purpose of determining the origin and profile of radiant existence from the Earth's atmosphere is considered. Methods of addition of three channels at 0.5, 1.0 and 1.6 micron m to the present 0.7 micron m visible channel and an 18-25 micron m channel to the present 19 channels spaced from 3.7 micron m to 15 micron m are addressed. Optical components and physical positions were found that permit inclusion of these added channels with negligible effect on the performance of the present 20 channels. Data format changes permit inclusion of the ERB data in the 288 bits allocated to HIRS for each scan element. A lamp and collimating optic assembly may replace one of the on board radiometric black bodies to provide a reference source for the albedo channels. Some increase in instrument dimensions, weight and power will be required to accommodate the modifications. A.R.H.

ORBIT TRANSFER VEHICLE ENGINE STUDY. VOLUME 2: TECHNICAL REPORT Final Report
31 Jul. 1980 206 p
(Contract NAS8-33444)
(NASA-CR-161564; FR-13168-Vol-2) Avail: NTIS HC A10/MF A01 CSCL 21M

The orbit transfer vehicle (OTV) engine study provided parametric performance, engine programmatic, and cost data on the complete propulsive spectrum that is available for a variety of high energy, space maneuvering missions. Candidate OTV engines from the near term RL 10 (and its derivatives) to advanced high performance expander and staged combustion cycle engines were examined. The RL 10/RL 10 derivative performance, cost and schedule data were updated and provisions defined which would be necessary to accommodate extended low thrust operation. Parametric performance, weight, envelope, and cost data were generated for advanced expander and staged combustion OTV engine concepts. A prepoint design study was conducted to optimize thrust chamber geometry and cooling, engine cycle variations, and controls for an advanced expander engine. Operation at low thrust was defined for the advanced expander engine and the feasibility and design impact of kitting was investigated. An analysis of crew safety and mission reliability was conducted for both the staged combustion and advanced expander OTV engine candidates. T.M.

(NASA-CR-161574; PWA-FR-13168-Vol-3) Avail: NTIS HC A03/MF A01 CSCL 21H

Budgetary and planning cost estimates are presented that were prepared for the development, production and operation and flight support phases for each of the engines proposed for OTV propulsion. The major features of each category engine are described. The development program estimates were structured to the preliminary program Work Breakdown Structures (WBS). Program costs are provided within the applicable WBS elements to Level 4 for each category engine. The production program cost estimates assume a first production lot of 50 units produced at a rate of two units per month. Cumulative average unit costs assume a 90% learning capability. The operations and flight support cost estimates are based on 15, 30 and 45 missions per year for the period 1988 through 1999. Estimated funding requirements were developed for each category and program phase. All cost estimates and funding data are presented in 1979 dollars. The assumptions and ground rules for these estimates are summarized. A.R.H.

PHOTOGRAPHIC SPECTROSCOPIC MEASUREMENT OF ULTRAVIOLET SOLID ROCKET MOTOR PLUMES Final Report
Dennis R. Keefer, William J. Phillips, and Kenneth E. Hanwell 7 Feb. 1980 17 p refs
(Contract N60530-78-C-0020; ZF32392002)
(AD-A088438; UTSI-GD-TR-80-1) Avail: NTIS HC A02/MF A01 CSCL 17/5

Photographic spectra having a nominal bandpass of 0.4 nm were obtained from the radiation from several solid rocket motor exhausts in the spectral region 250 nm to 430 nm. The spectra consisted primarily of a continuum with some molecular band structure which was found to originate from the molecules OH, PbO, NO CHO. These molecular bands were more pronounced in the region 290 nm to 320 nm, but the radiating systems involved extend to shorter wavelengths. The source of the continuum radiation was not determined explicitly, but is not inconsistent with a CO and O recombinations mechanism. GRA

RADIANT PANEL TESTS ON AN EPOXY/CARBON FIBER COMPOSITE
R. Ballard, D. E. Cagliostro, M. Gross, Ming Ta Hsu, and W. Winslow Mar. 1980 41 p refs Prepared in cooperation with San Jose State Univ., California
(NASA-TM-81185; A-8110) Avail: Issuing Activity CSCL 07B

The toxicity of epoxy/carbon fiber composites in fire environments is addressed. A radiant panel test chamber was developed to study the effects of pyrolysis of polymeric materials. The thermal response of the sample and the composition of gas and aerosol produced are determined. Toxicological effects of the gas and aerosol in the chamber are determined by studying changes in cardiac action, respiration, blood enzymes, and delayed escape responses in test animals. Data are presented for pyrolysis of an epoxy/carbon fiber composite at 2.5 W/sq cm. Nonflame and flame modes produced different gas and aerosol compositions and had different toxic effects. Nonflame modes produced large quantities of organic aerosols and carbon monoxide. These were not lethal but could hinder escape and may pose a long term toxic effect. The flame condition produced hydrogen cyanide in addition to other toxic products. M.G.

A MICRODEBONDING TEST FOR IN-SITU FIBER-MATRIX BOND STRENGTH AND MOISTURE EFFECTS
J. F. Mandell, J-H. Chen, and F. J. McGarry Feb. 1980 26 p refs
(Contract DAAG46-77-C-0770)
(R80-1) Avail: NTIS HC A03/MF A01

A test technique which gives a quantitative measure of the in situ fiber/matrix bond strength in composites is described. The test involves the compressive loading of a fiber or region of fibers on a polished specimen surface to produce debonding. Results are given for the debonding load for glass, aramid and graphite/epoxy composites. The change in debonding load is followed as the interface degrades during moisture conditioning at different points through the thickness. Refinements are needed to simplify interpretation of the debonding force in terms of interface shear strength, and to make the test more reproducible. S.F.

FRACTURE TESTING OF INJECTION MOLDED GLASS AND CARBON FIBER REINFORCED THERMOPLASTICS
J. F. Mandell, A. Y. Darwish, and F. J. McGarry Nov. 1979 36 p refs Sponsored by the Lord Corp.
(MIT-CE-R79-4) Avail: NTIS HC A03/MF A01

Polycarbonate, polysulfone, Nylon 6/6, polyphenylene sulfide and poly(amide-imide) samples containing either 40 percent graphite or 30-40 percent glass fibers were tested for fracture toughness, using linear elastic fracture mechanics methods. SEN specimens consistently positioned in centergated injection molded plaques gave KQ values insensitive to C/W ratio. These ranged from 2.8 to 10.5 (MNm)-3/2 reflecting the strong effects of fiber orientation. The toughness values of ductile and brittle matrices, greatly different when unreinforced, converged to similar levels (7-9(MNm)-3/2), with the addition of either fiber. A correlation between crack tip plastic zone size and longest fiber length appeared consistent with the dominant crack propagation mode which emphasized fiber avoidance: matrix and interface rather than fiber fracture. COATINGS FOR GRAPHITE FIBERS Final Report
F. S. Galasso, D. A. Scola, and R. D. Veltri Aug. 1980 104 p refs
(Contract NAS1-14346)
(NASA-CR-159304; R80-914212-22) Avail: NTIS HC A06/MF A01 CSCL 11D

Graphite fibers released from composites during burning or an explosion caused shorting of electrical and electronic equipment. Silicon carbide, silica, silicon nitride and boron nitride were coated on graphite fibers to increase their electrical resistances. Resistances as high as three orders of magnitude

higher than uncoated fiber were attained without any significant degradation of the substrate fiber. An organo-silicone approach to produce coated fibers with high electrical resistance was also used. Celion 6000 graphite fibers were coated with an organo-silicone compound, followed by hydrolysis and pyrolysis of the coating to a silica-like material. The shear and flexural strengths of composites made from high electrically resistant fibers were considerably lower than the shear and flexural strengths of composites made from the lower electrically resistant fibers. The lower shear strengths of the composites indicated that the coatings on these fibers were weaker than the coating on the fibers which were pyrolyzed at higher temperature. T.M.

RESEARCH ON GRAPHITE REINFORCED GLASS MATRIX COMPOSITES Interim Report, Jun. 1978 - Feb. 1980
K. M. Prewo and E. R. Thompson Feb. 1980 95 p refs
(Contract NAS1-14346)
(NASA-CR-159312; R80-912545-49) Avail: NTIS HC A05/MF A01 CSCL 11D

High levels of mechanical performance in tension, flexure, fatigue, and creep loading situations of graphite fiber reinforced glass matrix composites are discussed. At test temperatures of up to 813 K it was found that the major limiting factor was the oxidative instability of the reinforcing graphite fibers. Particular points to note include the following: (1) a wide variety of graphite fibers were found to be comparable with the glass matrix composite fabrication process; (2) choice of fiber, to a large extent, controlled resultant composite performance; (3) composite fatigue performance was found to be excellent at both 300 K and 703 K; (4) composite creep and stress rupture at temperatures of up to 813 K was limited by the oxidative stability of the fiber; (5) exceptionally low values of composite thermal expansion coefficient were attributable to the dimensional stability of both matrix and fiber; and (6) component fabricability was demonstrated through the hot pressing of hot sections and brazing using glass and metal joining phases. STABILITY OPTIMIZATION OF LAMINATED COMPOSITE PLATES
Yoichi Hirano Jul. 1980 19 p refs
(Grant NGL-33-018-003)
(ISAS-579-Vol-45-No-4; NASA-CR-163456) Avail: NTIS HC A02/MF A01 CSCL 11D

The optimum design of plates with orthotropic layers under axial compression and shear is discussed. The plates considered are the laminates of N orthotropic layers whose principal material axes coincide with the plate axes. Each layer is assumed to have the same thickness and an equal number of fibers in the direction of + alpha sub i and - alpha sub i with respect to the plate axis. The fiber directions which give the highest axial buckling stress and the highest shear buckling stress are found by utilizing a mathematical optimization technique for various aspect ratios of the plates. Inhomogeneity in the direction of the plate thickness (stacking sequence) is taken into account in this analysis. Author

DETERMINATION OF KINETIC PARAMETERS FOR THERMAL DECOMPOSITION OF PHENOLIC ABLATIVE MATERIALS BY MULTIPLE HEATING RATE METHOD Final Report
J. B. Henderson, J. A. Wiebelt, M. R. Tant, and G. R. Moore Jul. 1980 33 p refs
(ZR0000101)
(AD-A087929; NSWC/TR-80-204) Avail: NTIS HC A03/MF A01 CSCL 07/3

The rate of decomposition for two widely used glass- and asbestos-phenolic ablative materials were measured using standard thermogravimetric techniques. Thermograms were obtained at six heating rates ranging from 10 degrees C/min to 160 degrees C/min. From these data, the kinetic parameters were determined by a slightly modified version of Friedman's method. Fractional weight loss calculated using the derived kinetic parameters over the temperature range of decomposition agreed with measured values with a mean error of 0.33 and 0.28 percent, with a standard deviation of errors 0.58 and 0.84 percent for glass and asbestos-phenolic, respectively. The 95 percent confidence for the mean error was 0.22 and 0.44 percent for the glass-phenolic and 0.14 and 0.42 percent for the asbestos-phenolic. Also, the activation energy was calculated by the Flynn and Wall method. The average activation energy values determined by the two methods agreed within 4.6 percent for both materials. GRA

STRESS IN POROUS THIN FILMS THROUGH ADSORPTION OF POLAR MOLECULES
E. H. Hirsch Mar. 1980 27 p refs
(AD-A087770; ERL-0124-TR; AR-001-952) Copyright. Avail: NTIS HC A03/MF A01 CSCL 11/6

Films of magnesium fluoride are found to be under large tensile stress following exposure to water vapor. It is shown that this stress, which varies reversibly in magnitude with the adsorption equilibrium, can be attributed to electrostatic dipole interaction between the adsorbed water molecules. The effect is not confined to magnesium fluoride, but can occur in other materials of an appropriate porous structure. Its relevance to the stability of optical coatings is discussed, together with some other applications. GRA

FLAW DETECTION AND EVALUATION OF COMPOSITE CYLINDERS USING LASER SPECKLE INTERFEROMETRY AND HOLOGRAPHY
Terry L. Vandiver 23 Nov. 1979 88 p refs
(AD-A088206; AD-E950017; DRSMI-RL-80-7-TR) Avail: NTIS HC A05/MF A01 CSCL 14/2

The objective of this work was to determine what constitutes a flaw in a composite tube. Speckle interferometry and holography were used to measure surface displacements of 108 fiber reinforced thin wall cylinders. E-glass, S-glass and Kevlar fibers were used. Cut fiber and impact flaws were investigated. A new automated laser speckle interferometry displacement contour analyzer was used in conjunction with a computer for data analysis. The system analyzes 5000 data points in less than four minutes. Full field reconstruction of laser speckle interferograms and holograms is presented. The techniques described give the investigator a full field displacement picture of the flawed structures as well as displacement data that can be used to determine stresses and strains. GRA

CHEMICAL, SPECTRAL, STRUCTURAL, AND CHARGE TRANSPORT PROPERTIES OF THE MOLECULAR METALS PRODUCED BY IONIZATION OF NICKEL PHTHALOCYANINE Interim Report
Raymond P. Scaringe, Charles J. Schramm, Djordje R. Stojakovic, Brian M. Hoffman, James A. Ibers, and Tobin J. Marks 17 Jul. 1980 72 p refs Submitted for publication
(Contract N00014-77-C-0231; Grants NSF DMR-76-80847-A01; NSF DMR-77-26409; NR Proj. 053-640)
(AD-A087553; TR-11) Avail: NTIS HC A04/MF A01 CSCL 07/3

Partial oxidation of metallophthalocyanines with iodine has provided an extensive new class of molecular conductors. As illustrated in the present case with nickel phthalocyanine, the properties of the resulting solid state array of pi-cation radicals include electrical conductivity which is comparable with that of the best-known stacked molecular conductors. A particularly intriguing feature of NiPcI1.0 charge transport is a transition from metallic to semi-conducting behavior which apparently is not reflected in the magnetic properties of the carriers. It is tempting to speculate that this behavior reflects a change in carrier mobility brought about by some subtle structural rearrangement such as a change in the ordering of the triiodide chains. In a broader perspective, the iodinated metallophthalocyanines, such as those reported here, represent the first entry into a widening area of conductive materials based upon the ligand pi systems of mixed-valent metallo-macrocyclic arrays. Clearly the insights gleaned and the methodology developed will lead to an ever-deepening understanding of those molecular characteristics which facilitate charge conduction and which optimize materials performance. LUMINESCENT TELLURIUM-DOPED CADMIUM SULFIDE ELECTRODES AS PROBES OF SEMICONDUCTOR EXCITED-STATE DEACTIVATION PROCESSES IN PHOTOELECTROCHEMICAL CELLS
Arthur B. Ellis, Bradley R. Karas, and Holger H. Streckert 12 Aug. 1980 30 p refs Submitted for publication
(Contract N00014-78-C-0633; NR Proj. 051-690)
(AD-A088532; TR-3) Avail: NTIS HC A03/MF A01 CSCL 07/4

Correlations between quantum efficiencies for photocurrent (phi (x)), emission (phi r), and nonradiative recombination (phi (nr)) are discussed with reference to data from single-crystal, n-type, 100 and 1000 ppm CdS:Te-based photoelectrochemical cells (PECs) employing aqueous sulfide electrolyte. These materials emit while they serve as PEC electrodes. The assumption that the proportionality of phi (r) to phi (nr) is unaffected by potential leads to a simple expression relating phi (x) to phi (r) for monochromatic excitation. Calculated and observed emission data are in reasonable agreement; sources of deviation are discussed. Polychromatic excitation is shown to yield photocurrent and emission intensity which is approximately a weighted average of the values obtained with the constituent monochromatic frequencies. Practical implications of the phi (x) correlation with phi (r) are described, as are related results from other PECs. GRA

VIBRATIONAL SPECTRA OF CARBON MONOXIDE CHEMISORBED ON ALUMINA-SUPPORTED NICKEL

PARTICLES: A TUNNELING SPECTROSCOPY STUDY
R. M. Kroeker, W. C. Kaska, and P. K. Hansma 29 Jul. 1980 24 p refs Submitted for publication Prepared in part by California Univ., Santa Barbara
(Contract N00014-78-C-0011)
(AD-A088044; TR-4) Avail: NTIS HC A03/MF A01 CSCL 07/4

Tunneling spectroscopy is used to study the chemisorption of CO on small nickel particles. The particles are grown from vapor on a thermally oxidized aluminum substrate. Carbon monoxide is observed to chemisorb in at least four distinct ways, giving CO stretching frequencies of 256.5, 246, 222 and 207 meV. The 256.5 meV species has low frequency modes at 45.5 and 59.5 meV. The low frequency modes of the remaining three species are not resolved sufficiently for identification. The frequencies of all modes were found to have some coverage dependence. The largest shift is seen in a CO stretching vibration that moves from 200 to 207 meV with increasing coverage. The effect of H2 co-adsorption is examined and evidence for the presence of oxygen on the particles is presented. The reaction of the chemisorbed CO with H2 on these nickel particles is found to produce very little surface hydrocarbon in contrast to results found previously for rhodium particles under similar conditions. IDENTIFICATION AND QUANTIFICATION OF HYDROCARBON PRODUCTS IN EFFLUENTS Interim Report
R. S. Vogel, W. J. Mikucki, R. J. Fileccia, and R. G. Lampo May 1980 62 p refs
(DA Proj. 4A7-62720-A-896)
(AD-A088268; CERL-IR-N-91) Avail: NTIS HC A04/MF A01 CSCL 07/3

This report documents interim results of a study to (1) investigate the capability of infrared (IR) spectroscopy for the identification of specific hydrocarbon products in effluents from washracks and other vehicle service operations at Army installations, and (2) make a comparative evaluation of the Environmental Protection Agency's (EPA) gravimetric (STORET 00556) and IR (STORET 00560) methods of quantifying 'total hydrocarbons' in wastewater. Results have shown that IR spectroscopy can provide a basis for the identification of hydrocarbon products for which reference samples are available. In the initial phase of the work, a scheme of sequential discriminant analysis and pattern recognition was used with reference to a file of military specification (MIL SPEC) hydrocarbon products used in servicing wheel and track type Army vehicles. The complexity of IR data reduction was shown to increase rapidly with the number of hydrocarbon products present in a given sample, a result of a similarity in the hydrocarbon components' molecular structure. The use of gas liquid chromatography (GLC) in conjunction with IR spectroscopy provided additional discrimination and simplified data reduction. A comparative investigation of the gravimetric vs IR methods for the quantification of 'total hydrocarbons' in wastewater showed that the IR method was capable of higher precision than the gravimetric method at hydrocarbon concentrations less than 10 mg/l, and could provide information on chemical composition and consequently the origin of the hydrocarbon product. (AD-A088114; AFOSR-80-0586TR) Avail: NTIS HC A02/MF A01 CSCL 20/3

A model for the motion of n charged particles on the x-axis is described which leads to a system of delay differential equations with delays dependent on the unknown trajectories. If appropriate past histories of the trajectories are given, say on a,0, then for sufficiently small t > or = 0 there is a system of n(2) ordinary differential equations of the form y' = f(t,y) with y(0) = y sub 0 given. A generalized Lipschitz type condition is developed which is satisfied in the electrodynamics case. It is demonstrated that solutions of the equations of motion exist and are unique as long as no two particles collide. M.G.

COMPOSITION AND TEMPERATURE DEPENDENCE OF SHEAR VISCOSITY OF HYDROCARBON MIXTURES Final Technical Report, 1 Jun. 1979 - 31 May 1980
M. Adel-Hadadi, A. V. Lesikar, and C. Moynihan Jul. 1980 108 p refs
(Contract N00019-79-C-0329)
(AD-A088236) Avail: NTIS HC A06/MF A01 CSCL 07/3

Shear viscosities and densities have been measured from 50 C to as low as -56 C for five C10 hydrocarbons: n-decane, n-butyl cyclohexane, cis-decalin, n-butyl benzine and 2,7-dimethyl octane and their mixtures. A literature review of theories of hydrocarbon mixture viscosities has been carried out. It is shown that previous theories, in general, cannot give a good account of the mixture viscosities over the wide temperature range covered in this study. Two simple semiempirical equations have been developed and applied to the description of the combined composition temperature dependence of the viscosity of both the hydrocarbons studied under the present contract and two polycyclic hydrocarbons studied under a parallel Air Force Contract.

The equations assume additivity of component free volumes in the mixtures and contain no more adjustable parameters than are required to account for the viscosities of the pure hydrocarbon components. GRA

ERROR PROPAGATION AND OPTIMAL PERFORMANCE IN MULTICOMPONENT ANALYSIS Interim Technical Report
Clemens Jochum, Peter Jochum, (Ludwig-Maximilians-Univ., Munich), and Bruce R. Kowalski Aug. 1980 36 p refs Submitted for publication
(Contract N00014-75-C-0536; NR Proj. 051-565)
(AD-A088207; TR-17) Avail: NTIS HC A03/MF A01 CSCL 07/4

A study of error propagation for multicomponent analysis in the presence of sample related interferences by the generalized standard addition method has been made. The results of the examination have led to an alternate experimental design and optimal computation algorithms which are tested using a four component spectrophotometric analysis. Additionally, the theory describes fundamental constraints to multicomponent analysis in the presence of chemical, physical and spectral interferences. GRA

A LINEAR RESPONSE THEORY APPROACH TO TIME-RESOLVED FLUORIMETRY Interim Technical Report
G. M. Hieftje and E. E. Vogelstein 18 Jul. 1980 54 p refs Submitted for publication
(Contract N00014-76-C-0838; NR Proj. 051-622)
(AD-A088211; TR-26; TR-33) Avail: NTIS HC A04/MF A01 CSCL 07/4

A new conceptual and instrumental approach to time-resolved chemical measurements is presented. Based on the concepts of information and linear response theory, the new approach is applicable to a number of different areas, including nuclear magnetic resonance spectrometry, high-speed kinetic measurements, gas chromatographic analysis, and time-resolved luminescence spectrometry. In the particular examples given, the new approach is applied to the determination of luminescence lifetime. Accuracy and simplicity of the method are emphasized and its application to chemical analysis discussed. GRA

HYDROGEN EXCHANGE IN SOME COAL-RELATED REACTIONS AT 400 C
Ben M. Benjamin, M. J. Michalczyk (Knox Coll., Galesburg, Ill.), and M. C. Woody 1980 12 p refs Presented at the AICE Conf., Philadelphia, 8 Jun. 1980
(Contract W-7405-eng-26)
(CONF-800610-7) Avail: NTIS HC A02/MF A01

The kinetics of the transfer of hydrogen from tetralin and other hydrogen rich solvents, or groups in coal were studied using the pure compounds, 1,2-diphenylethane (bibenzyl), and diphenylmethane as models. Because the thermolysis of the compound gives some different products when heated alone or when heated in the presence of a good hydrogen donor, such as tetralin, it was of interest to know where the cleavage fragments derive their hydrogen to give the final product. In order to resolve this aspect of the reaction, bibenzyl was prepared completely deuterated (99.8%) in the dimethylene linkage, and pyrolyzed in the presence of ordinary tetralin. From the data it is concluded that the benzyl radical, formed by cleavage of bibenzyl, gives toluene by abstracting hydrogen from tetralin. The product after 1 percent conversion was PhCD2H. In fact, in this mixture, tetralin-bibenzyl-d4 at 400 C, deuterium is lost from bibenzyl by exchange 3 to 4 times faster than it undergoes carbon-carbon bond scission. Thus, the chemistry of bibenzyl at 400 C is dominated by hydrogen exchange reactions. DOE

DEVELOPMENT OF A TEMPORALLY AND SPATIALLY RESOLVED GRAZING INCIDENCE SPECTROMETER
D. D. Dietrich, R. J. Fortner, D. F. Price, R. E. Stewart, C. Gilman (Physics International, Berkeley, Calif.), and H. Helava (Physics International, Berkeley, Calif.) 1980 13 p refs Presented at the 3d Topical Conf. on High Temp. Plasma Diagnostics, Los Angeles, 17 Mar. 1980
(Contract W-7405-eng-48)
(UCRL-83808; CONF-800320-5) Avail: NTIS HC A02/MF A01

Design considerations are presented for a grazing incidence spectrometer which will resolve both temporally and spatially the emission from a wide variety of plasmas. The basis of the design involves use of microchannel plates which are curved to conform to the Rowland circle to the spectrometer. The spectra are obtained when the anode is property biased. The use of multiple anodes allows gating and with appropriate delays results in sequential time resolution of a few nanoseconds. Simultaneous gating of the anodes with spatial resolution of less than 100 microns for any given time frame can also be obtained. The efficiency of this spectrometer is also compared with conventional grazing incidence spectrometers. DOE

QUANTITATIVE GAS ANALYSIS OF SULFUR DIOXIDE IN NITROGEN BY FOURIER TRANSFORM INFRARED SPECTROPHOTOMETER
Y. Koga, M. Sugie, S. Kondo, and S. Saeri Dec. 1979 21 p refs Transl. into ENGLISH from Bunseki Kagaku (Japan), v. 28, 1979 p 298-303 Sponsored by DOE
(UCRL-Trans-11554) Avail: NTIS HC A02/MF A01

A method for quantitative gas analysis of sulfur dioxide contained in nitrogen using the Fourier transform infrared spectrophotometer was established. On account of the strong adsorption properties of sulfur dioxide, the measuring method adopted was one in which the sample was made to flow inside the cell and in the sampling system. Measurements were conducted with a total pressure of 3 atm of the sample gas and with a spectrophotometer resolving power of 0.5/cm. This method has a range of application to sulfur dioxide concentrations ranging from 15% to 300 ppM, and the precision of analysis was 1.9%. DOE

THERMOCHEMICAL WATER-SPLITTING CYCLE, BENCH-SCALE INVESTIGATIONS AND PROCESS ENGINEERING Annual Report, 1 Oct. 1978 - 30 Sep. 1979
G. Caprioglio, K. H. McCorkle, G. E. Besenbruch, and J. S. Rode Mar. 1980 142 p ref
(Contract DE-AT03-76SF-90351; GA Proj. 3260)
(GA-A-15788) Avail: NTIS HC A07/MF A01

Process development work on the sulfur iodine thermochemical water splitting cycle is summarized. The work consisted of laboratory bench scale investigations, demonstration of the process in a closed loop cycle demonstrator, and process engineering design studies. A bench scale system, consisting of three subunits, was designed to study the cycle under continuous flow conditions. Progress on the installation and operation of subunits 1 and 2 is described. A closed loop cycle demonstrator was installed and operated. Operation of the sulfur iodine cycle was demonstrated in this system under recycle conditions. The process engineering addresses the flowsheet design of a large scale production process consisting of four chemical sections and one helium heat supply section. The completed designs for these sections are presented. The thermal efficiency of the process calculated from the present flowsheet is 47%. DOE

FUNDAMENTALS OF NITRIC OXIDE FORMATION IN FOSSIL FUEL COMBUSTION Progress Report, 29 Dec. 1978 - 28 Mar. 1980
Thomas Houser and Michael E. McCarville Jun. 1980 10 p refs
(Contracts DE-AC01-76ET-10593; EX-76-C-01-2018)
(FE-2018-16) Avail: NTIS HC A02/MF A01

It was assumed that a fraction (alpha) of decomposed pyridine formed an intermediate, a fraction of which (beta) was capable of reacting further to form HCN, and that formation was first order in intermediate. The following rate equation describes the data: rho/t = k/sub b/ alpa beta-k/sub b/rho. Rho is moles HCN formed/mole pyridine decomposed, t is contact time and k/sub b/ is the first order rate constant for the formation step. Since rho was independent of initial pyridine concentration, the formation step was necessarily first order. The fraction of decomposed pyridine which can form HCN at a given time ranged from 0.16 to 0.77, indicating a significant concentration of intermediate builds up at all conditions. No volatile product found in the pyrolysis is close to that range of yields, thus the precursor to the HCN must react further on leaving the reactor. DOE

FUNDAMENTALS OF NITRIC OXIDE FORMATION IN FOSSIL FUEL COMBUSTION Progress Report, 29 Sep. - 28 Dec. 1979
Thomas Houser Jun. 1980 12 p refs
(Contracts DE-AC01-76ET-10593)
(FE-2018-15) Avail: NTIS HC A02/MF A01

A rate equation for the oxidation of pyridine in the temperature range of 948 to 1048 K and for both fuel lean and rich mixtures was developed. The rate is first order in oxygen and half order each in pyridine and oxygen consumed, indicating catalysis by product(s). Measurements of the products indicated, at all temperatures from 948 to 1273 K, that HCN was the major volatile product containing nitrogen for fuel rich mixtures. Only at 1273 K were there large amounts of NO produced from fuel lean mixtures. At 1173 K and below only very small yields of NO, about 1% or less, were found. The papers on pyridine pyrolysis kinetics were revised and resubmitted. DOE

(Contracts DE-AS01-78ET-10741; ET-78-S-01-3177)
(FE-3177-5) Avail: NTIS HC A02/MF A01

Results of diffuse reflectance studies and quantitative X-ray powder diffraction measurements supported the proposal that Cu(+)/ZnO solid solution is the catalytically important moiety in low pressure methanol synthesis catalysts. A decrease in CO2 concentration led to a decrease in carbon conversion to methanol over Ak based Cu/ZnO catalysts. This difference in kinetic behavior showed a remarkable influence of the support on the course of the synthesis. The dependence of reaction rates on CO2 concentration was actively investigated for these catalysts and for La based ternary catalysts, as well as for binary and ternary catalysts doped with alkali metal ions such as Rb(+). Although the effects on the methanol synthesis kinetics in the presence of CO2 were very marked, oxides did not appear to change the composition of the product and all catalysts investigated here are still highly selective to methanol. CONDENSATION PROCESSES IN COAL COMBUSTION PRODUCTS Progress Report, 1 Jul. 1979 - 30 Jun. 1980
Joseph L. Katz and Marc D. Donohue Apr. 1980 12 p ref
(Contract DE-AS02-79ER-10456; ER-78-S-02-4947)
(DOE/ER-10456/1) Avail: NTIS HC A02/MF A01

Slag vaporization is a serious problem in high temperature coal combustion and gasification processes. Cooling of process gas streams causes the slag vapors to condense, but they do not necessarily do so at equilibrium. Predicting the compositions and properties of the condensing species requires modeling the nucleation processes occurring in these systems. Progress toward modeling this nucleation process and toward implementing the model with a computer code suitable for design calculations is reported. DOE

COAL COMBUSTION BY WET OXIDATION. WET OXIDATION OF COAL FOR ENERGY PRODUCTION: TEST PLAN AND PARTIAL RESULTS Interim Report
Jeffrie A. Bettinger 10 Jul. 1980 58 p refs
(Contract DE-FG01-78ET-12328)
(DOE/ET-12328/T1) Avail: NTIS HC A04/MF A01

A steam generating facility, employing the wet oxidation of coal as a heat source was studied. The higher the reaction temperature, the more complete is the combustion of coal. Operation at elevated temperatures and pressures present difficult design problems, and the necessary equipment is costly. With a reduction in temperature from 228 C to 232 C, the operating pressure is reduced by more than half, thus holding down the overall cost of the system. Both the enhancement of low temperature wet oxidation of coal, and the higher operating regions were studied. The coal selected for the first portion of this test is an Eastern Appalachian high-volatile-A Bituminous type, from the Upper Clarion seam in Pennsylvania. This coal was selected as being a typical high sulfur, eastern coal. The wet oxidation of coal to produce low pressure steam is a process suited for a high sulfur, low grade, coal. DOE

(Contract DE-AC04-76DP-00789)
(SAND-80-0641) Avail: NTIS HC A03/MF A01

The conception, development, and testing of: (1) an electro-agnetic viscometer and (2) an X-ray technique are reported. Both methods employ a falling metallic sphere in the melt and provide real-time data. Initial testing of the electromagnetic viscometer was performed at one bar and from 700 to 1300 C. Follow-on experiments with this viscometer were carried out at 1 bar and 0.466 Kbar (6.8 Kpsi) argon up to 1250 C at the Sandia Magma Energy Research Test Facility. The X-ray method was tested entirely at one bar and up to 1325 C. A simultaneous test series with both methods was performed at one bar. Various calibration glasses and basalts were used to evaluate the methods. Correlation of the two methods with each other and with reference data was within acceptable limits. DOE

INVESTIGATION OF CARS AND LASER-INDUCED SATURATED FLUORESCENCE FOR PRACTICAL COMBUSTION DIAGNOSIS Final Report, Aug. 1978 - Aug. 1979
A. C. Eckbreth, P. A. Bonczyk, and J. F. Verdieck May 1980 105 p refs
(Contract EPA-68-02-3105)
(PB80-190515; EPA-600/7-80-091) Avail: NTIS HC A06/MF A01 CSCL 07D

Results of experimental investigations aimed at developing nonperturbing, spatially precise, in situ diagnostic techniques to measure species composition and temperature in flame are given. The practical feasibility of coherent antistokes roman spectroscopy (CARS) was demonstrated in a program of researchscale combustor testing (results agreed to within 5% for combustion zone temperature measurements made with CARS and with shielded thermocouples). Laser induced saturated fluorescence was examined in regard to its capability for measuring CH, CN, and NO concentrations in flames. Saturation of the fluorescence in CH and CN was achieved and considerable insight into the physics of saturated fluorescence was examined in regard to its capability for measuring CH, CN, and NO concentrations in flames. Saturation of the fluorescence in CH and CN was achieved and considerable insight into the physics of saturated fluorescence was obtained. Promising initial results of NO fluorescence in flames are described. GRA

MATERIALS RESPONSE TO ULTRA-HIGH LOADING RATES Final Report

1980 152 p refs
(Contract MDA903-78-C-0038)
(NMAB-356) Avail: NTIS HC A08/MF A01

The equations of state, plastic yielding, empirical failure models, brittle crack propagation, ductile void growth, and adiabatic shear banding are individually examined. Current descriptions are examined in the light of the present understanding of deformation and failure mechanisms, in order to identify shortcomings and make recommendations for alleviating them. Existing deformation descriptions are found adequate for most present applications, but more effort is needed to obtain relevant dynamic material properties on the other hand, the description of dynamic material failure is in its infancy, and effort is required to advance both theory and experiment. M.G.

FRACTURE TOUGHNESS OF BRITTLE MATERIALS DETERMINED WITH CHEVRON NOTCH SPECIMENS

J. L. Shannon, Jr., R. T. Bursey, D. Munz (Karlsruhe Univ.), and W. S. Pierce [1980] 17 p refs Proposed for presentation at the 5th Intern. Conf. on Fracture, Cannes, France, 29 Mar. - 3 Apr. 1981; sponsored by the International Congress on Fracture
(NASA-TM-81607; E-600) Avail: NTIS HC A02/MF A01 CSCL 11F

The use of chevron-notch specimens for determining the plane strain fracture toughness (K sub Ic) of brittle materials is discussed. Three chevron-notch specimens were investigated: short bar, short rod, and four-point-bend. The dimensionless stress intensity coefficient used in computing K sub Ic is derived for the short bar specimen from the superposition of ligament-dependent and ligament-independent solutions for the straight through crack, and also from experimental compliance calibrations. Coefficients for the four-point-bend specimen were developed by the same superposition procedure, and with additional refinement using the slice model of Bluhm. Short rod specimen stress intensity coefficients were determined only by experimental compliance calibration. Performance of the three chevron-notch specimens and their stress intensity factor relations were evaluated by tests on hot-pressed silicon nitride and sintered aluminum oxide. Results obtained with the short bar and the four-point-bend specimens on silicon nitride are in good agreement and relatively free of specimen geometry and size effects within the range investigated. Results on aluminum oxide were affected by specimen size and chevron-notch geometry, believed due to a rising crack growth resistance curve for the material. Only the results for the short bar specimen are presented in detail. M.G.

PERFORMANCE OF TWO-LAYER THERMAL BARRIER SYSTEMS ON DIRECTIONALLY SOLIDIFIED Ni-Al-Mo AND COMPARATIVE EFFECTS OF ALLOY THERMAL EXPANSION ON SYSTEM LIFE

Stephan Stecura Washington Oct. 1980 35 p refs
(NASA-TM-81604; E-453) Avail: NTIS HC A03/MF A01 CSCL 11F

A promising two-layer thermal barrier coating system (TBS), Ni-16.4Cr-5.1Al-0.15Y/ZrO2-6.1Y2O3 (all in weight percent), was identified for directionally solidified Ni-Al-Mo (gamma/gamma' alpha). In cyclic furnace tests at 1095 C this system on gamma/gamma' alpha was better than Ni-16. 4Cr-5.1Al-0. 15Y/ZrO2-7.8Y2O3 by about 50 percent. In natural gas - oxygen torch rig tests at 1250 C the ZrO2-6.1Y2O3 coating was better than the ZrO2-7.8Y2O3 coating by 95 percent, on MAR-M509 substrates and by 60 percent on gamma/gamma' alpha substrates. Decreasing the coefficient of thermal expansion of the substrate material from 17-18x10 to the -6 power/C (MAR-M200 + Hf and MAR-M509) to 11x10 to the -6 power/C (gamma/gamma' alpha) also resulted in improved TBS life. For example, in natural gas - oxygen torch rig tests at 1250 C, the life of Ni-16.4Cr-5.1Al-0.15Y/ZrO26.1Y2O3 was about 30 percent better on gamma/gamma' alpha than on MAR-M509 substrates. Thus compositional changes in the bond and thermal barrier coatings were shown to have a greater effect on TBS life than does the coefficient of thermal expansion. Author

CREEP-RUPTURE BEHAVIOR OF SEVEN IRON-BASE ALLOYS AFTER LONG TERM AGING AT 760 DEG IN LOW PRESSURE HYDROGEN Final Report

Walter R. Witzke and Joseph R. Stephens Aug. 1980 40 p refs
(Contract EC-77-A-31-1040)
(NASA-TM-81534; DOE/NASA/1040-15; E-486) Avail: NTIS HC A03/MF A01 CSCL 11F

Seven candidate iron-base alloys for heater tube application in the Stirling automotive engine were aged for 3500 hours at 760 C in argon and hydrogen. Aging degraded the tensile and creep-rupture properties. The presence of hydrogen during aging caused additional degradiation of the rupture strength in fine grain alloys. Based on current design criteria for the Mod 1 Stirling engine, N-155 and 19-9DL are considered the only alloys in this study with stregnths adequate for heater tube service at 760 C. Author

LONG-TIME CREEP BEHAVIOR OF THE TANTALUM ALLOY ASTAR 811C

William D. Klopp, Robert H. Titran, and Keith D. Sheffler (Pratt and Whitney Aircraft, East Hartford, Conn.) Sep. 1980 21 p refs
(NASA-TP-1691; E-041) Avail: NTIS CSCL 11F

The high vacuum creep behavior of Astar 811C (Ta-8W-1Re-0.7Hf-0.025C) was studied over the temperature range 800 C to 1700 C as a function of stress, temperature, and grain size in order to develop a relation for predicting long term creep. Primary

creep strain was related to time by the Garofalo exponential function, and a second exponential term was developed to describe the tertiary creep portion of the creep curve. No significant periods of secondary (linear) creep were observed. The creep curves were well expressed by a relation that includes terms for primary and tertiary creep. The initial and tertiary creep rates were obtained by differentiating the respective terms from the strain time relation and can be related to temperature by using a dual activation energy to account for lattice and dislocation core diffusion. The strain parameters were determined as power functions of the applied stress. A.R.H.

LOW-TEMPERATURE SOLDER FOR JOINING LARGE CRYOGENIC STRUCTURES
John D. Buckley and Paul G. Sandefur, Jr. Washington Sep. 1980 15 p refs
(NASA-TM-81836; L-13712) Avail: NTIS HC A02/MF A01 CSCL 11F

Three joining methods were considered for use in fabricating cooling coils for the National Transonic Facility. After analysis and preliminary testing, soldering was chosen as the cooling coil joining technique over mechanical force fit and brazing techniques. Charpy V-Notch tests, cyclic thermal tests (ambient to 77.8 K) and tensile tests at cryogenic temperatures were performed on solder joints to evaluate their structural integrity. It was determined that low temperature solder can be used to ensure good fin-to-tube contact for cooling-coil applications. Author

VIBRATIONAL FREQUENCIES OF HALOGEN ATOMS ADSORBED ON SILVER METAL SURFACES
Henry Nichols and Robert M. Hexter 17 Jul. 1980 24 p refs Submitted for publication
(Contract N00014-77-C-0209; NR Proj. 051-642)
(AD-A087664; TR-5) Avail: NTIS HC A02/MF A01 CSCL 11/6

The vibrational frequencies of halogens adsorbed on Ag 100 are calculated. The frequency of a single adsorbed atom vibration perpendicular to the surface is obtained from AgX (X = F, Cl, Br, I) crystal frequencies. Interaction between dipoles consisting of the effective charge on the absorbed atom and its induced image charge produces a coverage dependent frequency. The effective charge on the adsorbed atom is assumed to be 1.0 e, while the electronic polarizability of the real-plus-image atom system is assumed to be twice the electronic polarizability of x(-). At full coverage, the calculated frequencies for the k = 0 modes are 437, 241, 150, and 113/cm respectively for X = F, Cl, Br, and I, which compare well with experimental values, and these frequencies are assigned to external vibrational modes of halogen atoms adsorbed on silver. INTERATOMIC FORCES IN SOLID AND LIQUID TRANSITION METALS Final Technical Report, Apr. 1978 - Mar. 1980
N. H. March and C. C. Matthai Jan. 1980 93 p refs
(Grant DA-ERO-78-G-052; DA Proj. 1T1-61102-BH-57)
(AD-A087672) Avail: NTIS HC A05/MF A01 CSCL 07/2

The objective was to obtain a practical description of the force fields in transition metals. Central pair potentials for Ni and Pt have been constructed in agreement with calculations and experiments. The obtained representation of the force field is very useful for f.c.c. solid transition metals. X-ray scattering factors showed that charge distribution in b.c.c. transition metals is highly angular. Bond charge model has been used to represent this angularity. GRA

NEUTRON IRRADIATION EFFECTS ON FATIGUE CRACK PROPAGATION IN TYPE 316 STAINLESS STEELS AT 649 DEG C
D. J. Michel and H. H. Smith 1 Aug. 1980 20 p refs
(Contract DE-AI05-80OR-20352)
(AD-A088052; NRL-MR-4282) Avail: NTIS HC A02/MF A01 CSCL 11/6

The fatigue and creep fatigue crack propagation performance of Type 316 stainless steel was investigated following fast neutron irradiation to a fluence level of about 5 x 10 to the 22nd power n/sq. cm (> 0.1 MeV), about 26 displacements per atom (dpa), at 649 C. The results from fatigue tests of both annealed and 20 percent cold worked steel show that irradiation produced no significant effect on crack propagation rate when compared with unirradiated steel tested at 649 C. For tests conducted using creep fatigue cycling, the inclusion of a two minute hold time at the maximum cyclic load resulted in a marked increase in the crack propagation rate of the annealed steel. The effect of a one minute hold time in the 20 percent cold worked, irradiated steel was to significantly increase the crack propagation rate at 649 C. Scanning electron microscope examination of the tested specimens revealed that the crack propagation mode of the specimens which exhibited increased crack propagation rates was primarily intergranular while a transgranular mode was observed for specimens with lower crack propagation rates. The results point toward a synergistic relationship between thermochemical history, precipitate formation, and hold time effects as the responsible mechanism for the crack propagation performance. DIP PROCESS THERMAL BARRIER COATINGS FOR SUPERALLOYS Final Report, 1 Jul. 1979 - 30 Jun. 1980
I. M. Allam, R. W. Bartlett, and G. N. Krishnan Jun. 1980 38 p refs
(Contract F49620-79-C-0225; AF Proj. 2306; SRI Proj. PYU-8658)
(AD-A088064; AFOSR-80-0572TR) Avail: NTIS HC A03/MF A01 CSCL 11/6

A new technique of developing thermal barrier coatings for superalloys has been investigated. It involves hot dipping of superalloys samples into a molten bath of low melting Ce-Co or Ce-Ni alloy. By internally oxidizing these coatings, it is possible to obtain a duplex with a CeO2 rich oxide scale as the outer layer (thermal barrier) and an inner layer composite of fine cerium oxide particles dispersed in a matrix of Ni(Co)CrAl. This inner layer, or subscale, grades into the superalloy. Appropriate heat treatment can produce recrystallized CeO2 particles in the subscale that should improve adherence of the oxide scale to the subscale and substrate superalloy. The coating process does involve limited reaction between the coating alloy and superalloy. The thickness of this interaction zone can be controlled and compensated for in the design (cross section) of the superalloy component. GRA

FUNDAMENTALS OF CORROSION FATIGUE BEHAVIOR OF METALS AND ALLOYS
David J. Duquette Aug. 1980 33 p refs
(Contract N00014-75-C-0466)
(AD-A088358) Avail: NTIS HC A03/MF A01 CSCL 11/6

It is well known that environment plays a very important role in fatigue failures. In some cases only crack propagation rates are affected, however, for many others all of the steps leading to failure, pre initiation deformation, crack initiation and crack propagation are affected. For still other cases, only the crack initiation and early propagation processes are affected. This

paper attempts to evaluate the mechanisms which have been proposed for environmental effects on the early stages of fatigue damage, including crack initiation and early propagation in gaseous and in aqueous environments. Evidence is presented which indicates that there is no unifying theory of environmental fatigue, but that each alloy/environment couple may exhibit significantly different behavior, depending on factors such as thermodynamics and kinetics as well as microstructure, slip character, etc. GRA

THE AUSTENITIZING BEHAVIOR OF A LOW ALLOY STEEL
Peter A. Thornton May 1980 34 p refs
(AD-A088540; AD-E440079; ARLCB-TR-80013) Avail: NTIS HC A03/MF A01 CSCL 11/6

The austenitizing behavior of a low alloy steel was examined from both the microstructural and the mechanical property standpoint. The temperature range over which austenitizing took place was accurately determined by metallographic and analytical techniques. Metallographic evidence showed that the dissolution of carbide continues after the crystallographic transition is completed. Also, the dissolution of the preponderance of carbide coincides with a 'leveling-off' trend in mechanical property response, viz., yield strength and Charpy impact toughness. The data demonstrated that a minimum temperature of 774 C (1425 F) can sufficiently austenitize this steel under the appropriate conditions. However, because of chemical segregation invariably found in large forgings, it is a sound practice to allow some contingency in the heat treatment parameters that will consistently provide an adequate austenitizing condition in the thickest sections of a component. ELECTRODEPOSITION OF TANTALUM AND TANTALUM-CHROMIUM ALLOYS
I. Ahmad, W. A. Spiak, and G. J. Janz May 1980 37 p refs
Presented at Ann. Meeting of AIME, Las Vegas, Nev., 24-28 Feb. 1980
(AD-A088542; AD-E440082; ARLCB-TR-80014) Avail: NTIS HC A03/MF A01 CSCL 13/8

A part of a program to develop erosion resistant coatings for advanced gun barrels, electrodeposition of tantalum and tantalum chromium alloys from fused FLINAK (eutectic mixture of LiF-KF-NaF) has been investigated. Tantalum chromium alloys containing 2-6% chromium were obtained by codepositing tantalum and chromium from an electrolyte containing 10 wt% TaF5(added as K2TaF7) and 0.5-1.5% Cr (added as CrF3), at 800 C and 15-40 ma/sq cm current density. The alloy coatings were smooth and columnar in structure. The microhardness of these coatings increased with the increase of chromium content. GRA

SHOCK COMPRESSION OF TANTALUM Final Report
Willis Mock, Jr. and William H. Holt Jun. 1980 26 p refs
(NSWC MIPR A35200-9-0004)
(AD-A088152; NSWC/TR-80-92) Avail: NTIS HC A03/MF A01 CSCL 11/6

The free-surface velocity of a shock-loaded 3.73 mm thick tantalum disk has been measured with a capacitor gauge. Stress reverberations were produced in the tantalum disk by impacting it with a 2.65 mm thick alpha titanium disk at a velocity of 0.111 km/s in a gas gun. An initial shock compressive stress slightly larger than the measured 2.1 GPa Hugoniot elastic limit was produced in the tantalum. The shape of the free-surface-velocity profile suggested that spall fracture did not occur in the specimen disk at this stress level. This result was verified by examining the recovered and sectioned disk. GRA

INITIAL STAGES OF OXIDATION OF METALS AND ALLOYS Progress Report, 1 Aug. 1979 - 30 Apr. 1980
J. M. Blakely Apr. 1980 18 p
(Contract DE-AC02-79ER-10501)
(DOE/ER-10501/1) Avail: NTIS HC A02/MF A01

Investigations of metal surface oxidation are reported. Be and Fe-Ni single crystal surfaces were studied using the techniques of Auger and electron loss spectroscopy and low energy electron diffraction. A detailed study of the Auger line shape from clean cleaved Be (0001) planes has provided a standard against which all previous work may be composed. Progress has been made in preparing clean Be surfaces by ion sputtering techniques, computer processing of Auger data and some preliminary LEED studies have been made both of clean and oxygen covered surfaces. A liquid nitrogen cold stage for ribbon type single crystal samples has been constructed. The composition of the (100) surface of a Ni-60, Fe-40 single crystal has been investigated over the temperature range from 25 to 900 C. Under uhv conditions, only very slight enrichment in Fe occurs. Preliminary studies have also been made of surface structure and of C and S segregation to this Fe-Ni(100) surface. DOE

COMPARISON OF FLOW CURVES OF 6061 ALUMINUM ALLOY AT HIGH AND LOW STRAIN RATES
A. E. Carden, P. E. Williams, and R. R. Karpp 1980 15 p refs Presented at the Intern. Conf. on the Met. Effects of High Strain Rate Deformation and Fabric., Albuquerque, N. Mex., 22 Jun. 1980
(Contract W-7405-eng-36)
(LA-UR-80-1649; CONF-80061-5) Avail: NTIS HC A02/MF A01

Low strain rate tensile test data (10 to the -5 power to 10 to the -2 power/s) were obtained for 6061 aluminum alloy in the -T6- and -0- condition. Little, if any, strain rate effect was observed over this range of strain rates. Thirteen expanding ring tests were performed on 1 in. and 2 in. diam 6061-T6 and -0- temper rings with maximum strain rates of 3000 to 23,000/s. The flow stress at 2% circumferential exexpansion was determined from all of the tests and is shown to be dependent upon maximum strain rate. Furthermore, a size effect is observed, since flow stress at 2% strain and equal strain rates is greater in 2 in. rings than in 1 in. rings. This size effect may be due to shock hardening, but a definite conclusion has not yet been reached. The -T6- temper rings also show a size effect, but the difference between the 1 and 2 in. rings was not the same for all values of flow stress. DOE

PARAMETER MONITORING FOR CORROSION CONTROL OF UTILITY GAS TURBINES Annual Report

Mar. 1980 104 p refs
(EPRI Proj. 643-1)
(EPRI-AP-1369) Avail: NTIS HC A06/MF A01

The conditions that cause deposition of corrodents and an engine control system that will minimize their effect are discussed. Field data on 600 engines were statistically analyzed to determine the influence on hot corrosion of: fuel type; engine washing; air filtration; and proximity of the engine sites to oceans. Laboratory tests were conducted to determine the effect of: sodium sulfate with and without impurities; temperature cycling; and sodium in the fuel. Sodium ion concentrations in the air stream inside engines were monitored for evidence of impulsive shedding of accumulated salt. Results show that intermittent water washing reduces the incidence of corrosion. An engine control system which monitors the atmospheric and fuel-borne salt concentrations and signals the need for an engine water wash cycle to remove accumulated salt before corrosion commences was designed, built, installed, and checked out. This unit can also reduce power, therefore temperature, to slow the corrosion rate if the wash is not performed. DOE

FLUX PINNING IN BRONZE-PROCESSED Nb3Sn WIRES
M. Suenaga and D. O. Welch. 1980 13 p refs. Presented at the Intern. Cryog. Mater. Conf., Upton, N.Y., 28 May 1980
(Contract DE-AC02-76CH-00016)
(BNL-27964; CONF-800587-4) Avail: NTIS HC A02/MF A01

The scaling law derived by Kramer for magnetic flux pinning in high magnetic fields was examined for its applicability to the magnetic field dependence of critical-current densities in the bronze processed monofilamentary Nb3Sn wires. From this it was concluded that: (1) its prediction for the form of the dependence of critical current on magnetic field and grain size was found to be very good in most cases including wires with very small Nb3Sn grains. It was found very useful in comparison of J sub c for different wires and in extrapolating to obtain H sub c2 for these wires. (2) However, it could not account consistently for the anisotropy in critical current of a tape which was measured with H applied perpendicular and parallel to the tape face. (3) The values of Kappa sub 1 which were determined with the scaling law were too small by a factor of 2 to 3, and the trend in the variation with heat-treating time was opposite to that which is reasonably to be expected. DOE

CORROSION BEHAVIOR OF SEVERAL METALS IN ETHYLENE GLYCOL-BASE HEAT-TRANSFER FLUIDS UNDER CONDITIONS ENCOUNTERED IN SOLAR ENERGY SYSTEMS
G. J. Zeman. Jan. 1980 53 p refs
(Contract W-31-109-eng-38)
(ANL-79-96) Avail: NTIS HC A04/MF A01

The corrosion behavior of aluminum, copper, and iron in inhibited ethylene glycol-ASTM corrosive water solutions was evaluated in a laboratory loop under isothermal and heat flux conditions for 1000 h at temperatures between 378 and 413 K, in static autoclave tests at 450 K for 500 h, and by potentiodynamic polarization measurements at temperatures between 298 and 348 K. The effect of time, temperature, and ethylene glycol concentration of the heat transfer fluid on the extent of inhibitor depletion was determined from analyses of the reserve alkalinity, pH, and inhibitor content of the solutions. The performance of an electrochemical sensor as a monitor of fluid quality was also evaluated. A heat flux of 0.4 to 1.0 kW/sq m did not have a significant effect on the corrosion behavior of the various materials at temperatures between 378 and 413 K. The corrosion rates of aluminum, copper, and iron in the 50 volume percent inhibited ethylene glycol-corrosive water solution decreased as a function of time during the 1000 h test. At 413 K, the corrosion rate of copper was considerably higher than that of iron or aluminum at low flow velocity. DOE

MICROSTRUCTURE AND TENSILE PROPERTIES OF HEAVILY IRRADIATED 5052-0 ALUMINUM ALLOY
K. Farrell. 1980 23 p refs
(Contract W-7405-eng-26)
(CONF-800609-3) Avail: NTIS HC A02/MF A01

During neutron irradiation of an aluminum 2.2% magnesium solid solution alloy in the High Flux Isotope Reactor about seven percent insoluble, transmutant silicon was produced. Some of

this silicon reacted with the dissolved magnesium to form a fine precipitate of Mg2Si. A tight dislocation structure was also created. The alloy showed good resistance to cavity formation. Tension tests at 323, 373, and 423 K (0.35, 0.40, and 0.45 T sub m) showed pronounced irradiation-induced strengthening and an associated marked loss in ductility. These changes were greater than in magnesium free aluminum and in alloys containing preexisting, thermally aged Mg2Si precipitate. Increasing the thermal to fast flux ratio from 1.7 to 2.1 caused further strengthening beyond that expected from a simple increase in silicon level. DOE

Production of hydroxyl containing curable liquid hydrocarbon prepolymers by ozonizing a high molecular weight saturated hydrocarbon polymer such as polyisobutylene or ethylene propylene rubber is discussed. The ozonized material is reduced using reducing agents, preferably diisobutyl aluminum hydride, to form the hydroxyl containing liquid prepolymers having a substantially lower molecular weight than the parent polymer. The resulting curable liquid hydroxyl containing prepolymers can be poured into a mold and readily cured, with reactants such as toluene diisocyanate, to produce highly stable elastomers having a variety of uses such as binders for solid propellants.

PREPOLYMER DIANHYDRIDES. Patent
Robert A. Rhein (JPL) and John D. Ingham, inventors (to NASA) (JPL). Issued 1 Apr. 1980. 6 p. Filed 14 Aug. 1978. Continuation of abandoned US Patent Appl. SN-761252, filed 21 Jan. 1977. Sponsored by NASA.
(NASA-Case-NPO-13899-1; US-Patent-4,196,129;
US-Patent-Appl-SN-933186; US-Patent-Class-260-346.3;
US-Patent-Appl-SN-761252) Avail: US Patent and Trademark Office. CSCL 07A

A process for preparing dianhydrides that are miscible with hydroxyl prepolymers at moderate temperatures and can cure hydroxyl prepolymers to elastomers at moderate temperatures is disclosed. The dianhydrides are prepared by solution reaction of a prepolymer diol with excess hydride followed by removal of unreacted dianhydride. The prepolymer dianhydrides are miscible with hydroxyl substituted hydrocarbon prepolymers and cure the prepolymers to polyester-linked elastomers.

A self supporting sheet structure comprising a water soluble, noncrosslinked polymer such as polyvinyl alcohol which is capable of being crosslinked by reaction with hydrogen atom radicals and hydroxyl molecule radicals is contacted with an aqueous solution having a pH of less than 8 and containing a dissolved salt in an amount sufficient to prevent substantial dissolution of the noncrosslinked polymer in the aqueous solution. The aqueous solution is then irradiated with ionizing radiation to form hydrogen atom radicals and hydroxyl molecule radicals and the irradiation is continued for a time sufficient to effect crosslinking of the water soluble polymer to produce a water insoluble polymer sheet structure. The method has particular application in the production of battery separators and electrode envelopes for alkaline batteries.

TOUGHENING OF THERMOSETTING POLYIMIDES
David S. Gollob, John F. Mandell, and Frederick J. McGarry. Aug. 1979. 47 p. refs. Sponsored by NASA.
(NASA-CR-163594; MIT-CE-R79-1) Avail: NTIS HC A03/MF A01 CSCL 07C

Work directed toward increasing the resistance to crack propagation of thermoset polyimides is described. Rubber modification and Teflon microfiber impregnation techniques for increasing fracture toughness are investigated. Unmodified Kerimid 601 has a fracture surface work value of 0.20 in-lbs/sq in. Dispersed particles of amine terminated butadiene acrylonitrile liquid rubber or of silicone rubber do not raise this value much. By contrast, 5 percent of well fibrillated Teflon produces an eight-fold increase in fracture toughness. Further process improvements should increase this factor to 20-30. M.G.

(AD-A086943; LRSM-TR-80-7) Avail: NTIS HC A02/MF A01 CSCL 11/9

The results of an initial study of the microwave properties of low density foam-like (CH) sub x are reported for intermediate dopant levels. The electrical conductivity and dielectric constant are obtained at microwave frequencies, and the results are analyzed in terms of effective medium theory. The possibility of utilizing the doped foam-like (CH) sub x as an efficient microwave absorber is discussed. GRA

(AD-A087554; TR-12) Avail: NTIS HC A02/MF A01 CSCL 07/4

The properties of low-dimensional mixed valence material consisting of molecular stacks are critically dependent on the rather capricious and unpredictable intermolecular forces that dictate whether stacks form, whether the stacks are segregated, the orientation of donor with respect to acceptor, the relative orientation of units within a stack, and the stacking repeat distance. Discussed in this lecture are rational approaches to overcome such problems by combining polymer chemistry with recently developed methodology for synthesizing stacked, partially oxidized metallomacrocycles and for measuring the degree of incomplete charge transfer. New results on the chemical, structural, and electronic properties of highly conductive macro-molecules prepared by covalently linking metallomacrocycles in a rigid, face-to-face configuration as shown below, followed by doping, are presented. MECHANICAL PROPERTIES VERSUS MORPHOLOGY OF ORDERED POLYMERS Progress Report, 1 Sep. 1978 - 30 Aug. 1979
Edwin L. Thomas, R. J. Farris, and S. L. Hsu Wright-Patterson AFB, Ohio AFWAL May 1980 95 p refs
(Contract F33615-78-C-5175)
(AD-A087927; AFWAL-TR-80-4045) Avail: NTIS HC A05/MF A01 CSCL 11/9

Morphological techniques in conjunction with mechanical testing have been employed to determine the relationships between mechanical properties and morphology of a new class of high strength, high modulus, thermally stable aromatic heterocyclic polymers. The polymers studied were poly-p-phenylene benzobis-oxazole (PBO) and predominantly ploy-p-phenylene benzobisthiazole (PBT). The microstructural studies involved laser Raman and Fourier transform infrared spectroscopy, electron diffraction and electron microscopy, wide and small angle X-ray scattering and birefringence measurements. Mechanical measurements have employed ambient and high temperature mechanical testing as a function of strain rate and state of stress (uniaxial tension, double loop bending). The effect of processing conditions on fiber morphology and subsequently on mechanical properties has been studied for optimization of processing conditions for high strength and modulus rigid rod polymer fibers and films. STUDY OF EROSION MECHANISMS OF ENGINEERING CERAMICS, STATIC FATIGUE OF CERAMICS Final Report, 1 Apr. 1973 - 1 Jan. 1980
Mary Ellen Gulden 31 Jul. 1980 58 p refs
(Contract N00014-73-C-0401; NR Proj. 032-542)
(AD-A087959; MD80-37-BK) Avail: NTIS HC A04/MF A01 CSCL 11/2

Two areas were investigated in this program: solid particle erosion of engineering ceramics and static fatigue of ceramics. In the erosion phase, the target materials investigated were several types of Si3N4, glass bonded Al2O3 and magnesium fluoride. The particle types were SiC and natural quartz sand. Particle sizes ranged between 10 and 1000 microns and particle velocities were in the subsonic regime. The particle size and velocity dependence on erosion, effect of erosion on strength and effect of number of impacts on erosion were determined. It was found that the type of erosion damage produced was more a function of relative target particle properties than of particle size and velocity for the erosion regime investigated. 'Elastic-plastic' impact, which is characterized by plastic deformation in the particle contact area, and radial and lateral cracks propagating outward from the contact area was observed on all targets impacted with SiC particles. Damage from quartz particle impact ranged from elastic-plastic on the relatively soft targets like MgF2 to shallow intergranular chipping with no secondary crack formation for the hard targets such as hot-pressed Si3N4. Static fatigue behavior of four ceramics was determined in various aqueous solutions at temperatures to 900 C. GRA

The report describes the continued development and test verification of digital computer models used to simulate hydraulic systems under dynamic conditions. A hydraulic acoustic generator was built and tested for frequency response work. Pulsation attenuation techniques are presented and several modifications were made to the Hydraulic Frequency Response Computer Program (HSFR) including a standing wave plot option. An empirical time domain pump model was developed and additional verification and development of the piston pump transient model was accomplished. Several enhancements were made to the Hydraulic Transient Analysis Computer Program (HYTRAN). A quasi-transient capability was added to the Steady State Flow Analysis Computer Program (SSFAN). The SSFAN Program was updated to extend the calculation capability, add new component models, program features, and reduce the program size. Several programming features were added to the Hydraulic Transient Thermal Analysis Computer Program (HYTTHA) including a temperature default section and environment section. Further verification work was accomplished on the HYTTHA program. GRA

OXIDATIVE STABILIZATION OF ACRYLIC FIBERS. PART 5: THE DECOLORATION REACTION
S. S. Chen, J. Herms, L. H. Peebles, Jr., and D. R. Uhlmann Aug. 1980 73 p refs
(Contract N00014-75-C-0542; NR Proj. 356-534)
(AD-A088299; TR-13) Avail: NTIS HC A04/MF A01 CSCL 11/9

When acrylic fibers are heat treated for various times at 220-250 C, they form dark, insoluble structures of uncertain chemical character which are inert to many strong oxidizing and reducing agents. The heat treated fibers are, however, rapidly decolored by warm alkaline hypochlorite solutions. When fibers which have undergone short time heat treatment are subjected to the hypochlorite, incubation periods are observed before decoloration is noted; and a swollen acrylic network remains after decoloration is complete. The acrylic network is primarily unreacted precursor units save for a small amount of hydrolyzed material. The decoloration reaction is zero order, indicating a reaction at the surface. Prior to the decoloration reaction, there is a penetration or plasticization of the subsurface material by

elements of the solution, as indicated by the presence of chlorine atoms in the interiors of exposed fibers. The rate of the decoloration reaction increases with increasing duration of the stabilization heat treatment. The precise structure of the final material depends therefore on the original fiber composition and the processing variables. GRA

This contract research effort, a continuation of a previous Air Force supported contract (F33615-77-C-5101), was directed toward the development of a 65% volume solids, sprayable (airless electrostatic method), polyurethane exterior aircraft coating meeting MIL-C-83286B performance specifications. A high solids coating can significantly reduce solvent emissions and help the Air Force meet EPA/OSHA requirements for reduced environmental pollution and increased worker safety. One formulation, consisting of a combination of Acryloid AU-568 (oxazolidine), NIAX PCP-0300 (polyol), and Desmodur N-100 (polyisocyanate) was developed under the initial contract and found to exhibit performance properties closely approximating the program goals. During the present contract, this formulation was further evaluated. Attempts to upgrade the properties not meeting the performance specifications were made. Also, new commercially available resins were evaluated for incorporation into the high solids systems. GRA

Network polymers resins have been prepared from selected binary combinations of diglycidl ether of butanediol or diglycidl ether of bisphenol A with ethylene diamine, diethylene triamine, diaminodiphynyl methane, or diaminodiphenyl sulfone. Thermally stimulated discharge current analyses were performed on these materials in an effort to elucidate significant molecular motions through the temperature range, approximately 80 K to 460 K. Assignments of dielectrically and mechanically active loss processes to motions involving penyl groups, pendant hydroxyl groups, or aliphatic backbone segments could be made in cases where there were clear indications based on the temperature-dependence of activation energy. COLLECTOR SEALANTS AND BREATHING Final Report, 25 Sep. 1978 - 31 Dec. 1979
M. A. Mendelsohn, R. M. Luck, F. A. Yeoman, and F. M. Navish, Jr. 20 Feb. 1980. 278 p. refs.
(Contract DE-AC04-78CS-15362)
(DOE/CS-15362/1) Avail: NTIS HC A13/MF A01

The pertinent properties of a variety of possible sealants for solar collectors were investigated, the most promising candidates were identified, and the effect of breathing in flat plate, thermal solar collector units was studied. Two types of sealants, Class PS which includes preformed seals or gaskets and Class SC which includes sealing compounds or caulks were considered. Environmental stresses evaluated include elevated temperatures, moisture, ultraviolet light, ozone and oxygen, and fungus. Factors such as design, fabrication, materials of construction, seals and sealing techniques and absorber plate coatings were observed on actual field units removed from service. Such phenomena as leakage, corrosion and formation of deposits on glazing and absorber plate were noted. The properties of several desiccants were evaluated in order to provide means to mitigate the deleterious effects of water on collector life. Adsorbents for organic degradation products of sealants were also investigated in order to protect the glazing and absorber plate from deposited coatings. DOE

STRUCTURE-PROPERTY RELATIONSHIPS OF LINEAR METHYL-PHENYL-VINYL SILOXANE TERPOLYMERS
H. G. Hammon, E. S. Jessop, J. R. Kolb, and M. O. Riley. 8 May 1980. 10 p. refs. Presented at the Meeting of JOWOG, Kansas City, Mo., 25 Jun. 1980 and at the Am. Chem. Soc. Natl. Meeting, San Francisco, Aug. 1980. Submitted for publication.
(Contract W-7405-eng-48)
(UCRL-84303; CONF-800814-2; CONF-800628-2) Avail: NTIS HC A02/MF A01

The synthesis and characterization of siloxane polymers with properties tailored to meet specific design requirements is addressed. A series of 15 random terpolymers of dimethyl-diphenyl-methylvinyl siloxane were synthesized. In seven terpolymers the concentration of the methylvinyl repeat unit was varied from 0 to 5 weight percent maintaining phenyl content constant at 12 percent. The other eight terpolymers contained 0 to 18 weight percent phenyl repeat unit maintaining vinyl at one percent. The moduli increased directly with vinyl concentration, but the longation to break decreased until, at about two percent vinyl, the rubber becomes extremely friable. Increasing the phenyl content in the silicone decreased the degree of crystallinity and increases the polymer class transition in accord with theoretical predictions. The major effect of incorporation of phenyl groups is the elimination of the polymer's ability to crystallize at about three percent phenyl. This extends the rubbery plateau to the glass transition (-117 C) instead of the melting point (-44 C). DOE

SYNTHESIS AND CHARACTERIZATION OF NEW SILICONE CONDENSATION POLYMERS
N. L. Butler, H. G. Hammon, E. S. Jessop, J. R. Kolb, and M. O. Riley. 8 May 1980. 7 p. refs. Presented at the Meeting of JOWOG, Kansas City, Mo., 28 Jun. 1980 and at the Am. Chem. Soc. Natl. Meeting, San Francisco, Aug. 1980. Submitted for publication.

(Contract W-7405-eng-48)
(UCRL-84304; CONF-800814-1; CONF-800628-3) Avail: NTIS HC A02/MF A01

The synthesis of polysiloxanes as base polymers for cellular silicone materials is discussed. The polymers which are prepared via random equilibration of various cyclic tetrasiloxanes have adequate properties for certain applications but there is evidence to suggest that alternating block polysiloxanes prepared via condensation polymerization techniques have properties more desirable for use as flexible foam materials. The synthetic sequence involves reactions of functionally terminated (amino and hydroxy) polysiloxane oligomers to produce alternating block materials of high molecular weight dialkylamines as condensation by-products. Functional endcapping of these poly(dimethyl-diphenyl-methyl vinyl) siloxane copolymers with dimethylvinylsilyl groups is discussed. DOE

CR-39 POLYMER, A PROMISING NEW SOLID STATE TRACK RECORDER FOR HIGH ENERGY NEUTRON APPLICATIONS
F. H. Ruddy, C. C. Preston (San Francisco Univ.), R. Gold, E. V. Benton, and J. H. Roberts (Macalester Coll.) 14 Apr. 1980 22 p. refs
(Contract DE-AC14-76FF-02170)
(HEDL-SA-2149; CONF-800551-20) Avail: NTIS HC A02/MF A01

The CR-39 polymer, a solid state track recorder with unprecedented sensitivity to lightly ionizing particles (such as protons) is developed for eventual neutron dosimetry applications. The diameters of proton tracks are found to vary smoothly and reproducibly as a function of energy from 0.20 to 18.0 MeV. Preliminary results on the response of CR-39 polymer to proton tracks as a function of angle show a rapid decrease of the registration efficiency from 100% to 0 for incidence less than 7 degrees. Proton recoil track size distribution in CR-39 polymer irradiated with monoenergetic neutrons of varying energy are presented. Some proposed high energy netron dosimetry and radiography systems using CR-39 polymer are discussed. DOE

THE SYNTHESES OF NITRATE AND NITRITE SELECTIVE POLYMERS Ph.D. Thesis
Shang-Jaw Chiou 1979 175 p. refs
(PB80-195076; W80-05462; OWRT-A-979-Kan(2)) Avail: NTIS HC A08/MF A01 CSCL 07C

A high capacity nitrate and nitrite selective polymer was synthesized by attaching nitron to commercial polyvinylbenzyl chloride (60/40 ortho/para isomers). The capacity of this polymer to remove nitrate and nitrite from 0.001 M solution was 67% and 42% respectively. The compound 1 phenyl 2 diethylaminoethyl 4 amino benzoate was also synthesized and attached to commercial polyvinylbenzyl chloride. The nitrate and nitrite selectivity of this polymer was realized and the capacity of this polymer to remove nitrate and nitrite from aqueous solution was 76% and 65.6%, respectively. Another polymer was synthesized by attachment of 1 (4 nitrophenyl) 2 diethylaminoethyl 4 hydroxybenzoate to polyvinylbenzyl chloride (60/40 o/p isomers). The capacity of this polymer to remove nitrate and nitrite from aqueous solution was 80% and 68%, respectively. GRA

BIOLOGICAL DEGRADATION OF HYDRAZINE Final Report, Jun. 1977 - Aug. 1978
Michael G. MacNaughton, Jay A. Farmwald, Larry McDaniels, and Gregory Urda Oct. 1979 46 p. refs
(AF Proj. 2103)
(AD-A084426; AFESC/ESL-TR-79-38; CEEDO-TR-78-13) Avail: NTIS HC A03/MF A01 CSCL 13/2

Due to the increased procurement, storage, and transportation of hydrazine (HZ) in support of the Titan and Minuteman operational missiles, the space shuttle, and F-16 combat fighter programs, the Air Force Engineering and Services Laboratory has been tasked with documenting the effects of fuel spills and low level continuous flow discharges on publicly owned treatment works (POTW). Using 12 bench scale continuous flow recycle reactors, it was shown that treatment efficiency (as measured by COD removal) is not seriously impaired for slug doses which increase aeration basin HZ concentrations up to 44 mg/l. Chemical oxygen demand (COD) recovery times for slug doses of 243 mg/l were approximately 4 to 5 days. Nitrification ceased at HZ concentrations above 23 mg/l. The 'no effect' concentration with respect to ammonia oxidation was determined to be between 1 to 23 mg/l while nitrate recovery times for doses up to 243 mg/l wave were on the order of 10 days. Continuous influent HZ concentrations above 10 mg/l seriously degrade COD

removal capabilities. Nitrification under continuous feed conditions was inhibited above 1 mg/l. Author

IGNITION OF NOS 365 LIQUID PROPELLANT CONTAINING AN AIR BUBBLE UNDER SIMULATED VREECH PRESSURIZATION CONDITIONS Final Report

Vincent M. Boyle and Edwin A. OLeary Apr. 1980 42 p

(DA Proj. 1L1-61102-AH-80)

(AD-A085723; AD-E430452; ARBRL-TR-02236) Avail: NTIS HC A03/MF A01 CSCL 21/9

A setback simulator was used to generate pressure within a liquid propellant containing a suspended air bubble. The bubble volume was varied from 1 to 200 micro liters. Several tests were made using a 1000 micro liter air space above the liquid propellant. Conclusions reached were: (1) a suspended air bubble makes liquid propellant more sensitive to pressure ignition; (2) the intensity of the reaction appears to increase with bubble size; (3) higher pressurization rates cause ignition of neat liquid propellant. However, this may be due to extrusion of the propellant around the pistons; and (4) the impact mode of activator operation, although permitting higher pressures and pressurization rates than the contact mode, also gives more variability in the results. S.F.

TRANSIENT IGNITION MECHANISMS OF CONFINED SOLID PROPELLANTS UNDER RAPID PRESSURIZATION Summary Report, 1 Aug. 1979 - 31 Jul. 1980

Kenneth K. Kuo, Mridul Kumar, and Anil K. Kulkarni 6 Aug. 1980 58 p refs

(Contract N00014-79-C-0762)

(AD-A088080) Avail: NTIS HC A04/MF A01 CSCL 21/9

A comprehensive theoretical model was formulated to study the transient ignition mechanisms of solid propellants under rapidly varying pressure conditions. The model considers a two dimensional geometry to describe the ignition of a heterogeneous propellant. The rate of pressurization has been included in the energy equation to simulate rocket motor ignition conditions. The model does not make any a priori assumption of solid phase, heterogeneous, or gas phase ignition mechanism. Chemical reactions are considered in the gas phase, at the interface as well as in the subsurface. The most up to date chemical kinetics information is included in the model. A generalized ignition criterion has been proposed which allows ignition to occur at any site. GRA

SERVICE TEST OF TWO FUEL CONDUCTIVITY ADDITIVES Final Report, 1 Apr. 1977 - 1 Jan. 1980

Charles R. Martel and Frank P. Morse May 1980 86 p refs

(AD-A088046; AFWAL-TR-80-2051) Avail: NTIS HC A05/MF A01 CSCL 21/4

A service test of two fuel conductivity (anti-static) additives was conducted from April 1977 to May 1979 at eight Air Force bases. Since bases have continued to use the additive, a portion of the data reported herein extends to January 1980. The two candidate fuel additives were Shell Chemical Company's ASA-3 and E.I. duPont de Nemours and Company's Stadis 450. The additives were injected into the JP-4 aviation turbine fuel at either the refinery or terminal supporting the base. The conductivity of the JP-4 delivered to the service test base was to be maintained between 200 and 600 pS/m. The minimum and maximum fuel conductivity limits for servicing to aircraft was 100 to 700 pS/m. The effects of the additives on the air base fuel systems, filter separator elements, and on aircraft were monitored. GRA

DETONATIONS AND MOLECULAR ELECTRONIC STRUCTURE OF EXPLOSIVES: THEORY AND ITS APPLICATION TO (NO +) SUB n Technical Report, Oct. 1977 - Dec. 1978

Richard D. Bardo 30 May 1980 58 p refs

(ZR01301; ZR01305)

(AD-A088223; NSWC/TR-79-175) Avail: NTIS HC A04/MF A01 CSCL 19/1

The theory of the electronic structure of molecular systems is discussed. It is suggested that certain electronic excited states are diminished in energy during compression, and that intersections of ground and excited state potential energy surfaces occur, thereby creating much lower activation energy barriers and greatly enhancing reaction rates. The molecular system (NO+)n is treated as a prototype explosive system. Ab initio and semiempirical calculations on the ground and excited electronic states of (NO+)n are presented. Intersections of the surfaces are seen to occur, suggesting that at high compressions the activation energy for bond scission may be substantially reduced. It is also shown that the changes in excitation energies depend primarily on the interactions of two or three NO(+) molecules, which suggests an enormous simplification in the study of excited states. PREDICTED PERFORMANCE OF ENERGETIC PLASTICIZER FORMULATIONS

Larry P. Davis, Robert A. Hildreth, and Melvin L. Druelinger Jun. 1980 20 p refs

(AF Proj. 2303)

(AD-A087658; FJSRL-TR-80-0015) Avail: NTIS HC A02/MF A01 CSCL 21/9

Calculations of heats of formation (MNDO) and specific impulse for a series of bis-fluorodinitroethyl alkyl ethers have been made. This series also included oxygen and sulfur hetero atoms, N-H, N-NO2 and CFNO2 substituents. These calculations reveal a trend toward decreasing Isp values as the hydrocarbon chain increases. The results suggest that ideal target molecules for synthetic efforts are the smaller members of this family of compounds, and that such compounds could be of value in applications as energetic plasticizers in propellant/munition formulations. The results also indicate that these compounds are promising in view of their increased performance compared to formulations using non-energetic plasticizers. GRA

ALCOHOL PRODUCTION FROM AGRICULTURAL AND FORESTRY RESIDUES

R. Opilla, L. Dale, and T. Surles May 1980 30 p refs

(Contract W-31-109-eng-38)

(ANL/EES/TM-88) Avail: NTIS HC A03/MF A01

Technologies available for the production of ethanol from whole corn are reviewed with emphasis on the environmental aspects of the process, including land utilization and possible air and water pollutants. Changes intended to improve the

economics of the process as well as to reduce some of the pollution from by-product disposal are suggested. Ethanol may be derived from renewable cellulosic substances by either enzymatic or acid hydrolysis of cellulose to sugar, followed by conventional fermentation and distillation. The use of two corn stover (field stalks remaining after harvest) and straw from wheat crops as a cellulosic feedstock is discussed. The environmental impact of a two stage acid process and an enzymatic process for feedstock production is evaluated and residuals expected from the manufacture of methyl and ethyl alcohols from woody biomass are considered. The methanol is produced in a gasification process, whereas ethanol is produced by hydrolysis and fermentation processes similar to those used to derive ethanol from cellulosic materials. DOE

(Contract DE-AC02-77ET-20050)
(COO-4388-10; Rept-1987; PR-10) Avail: NTIS HC A04/MF A01

It was found that marine algae could be converted to higher aliphatic organic acids and that these acids could be readily removed from the fermentation broth by membrane or liquid-liquid extraction. It was then proposed to convert these higher organic acids via Kolbe Electrolysis to aliphatic hydrocarbons, which may be used as a diesel fuel. A coenzyme M analogue, 2-bromoethanesulfonic acid was shown to be an effective suppressor of methane in nonsterile anaerobic fermentation of cellulosic substrates. Preliminary experiments were completed utilizing corn meal in which 2-bromoethanesulfonic acid and carbon monoxide were both found to be effective methane suppressors. The energy outputs and requirements for the production of liquid hydrocarbon fuel from corn are analyzed. As a means of expanding the number of potential substrates, pretreatment schemes are being investigated. DOE

PRODUCTION OF SUGARCANE AND TROPICAL GRASSES AS A RENEWABLE ENERGY SOURCE Quarterly Report, 1 Dec. 1979 - 29 Feb. 1980
Alex G. Alexander, W. Allison, M. Garcia, G. Ramirez, T. L. Chu, J. Velez-Santiago, and L. Smith 1980 39 p refs
(Contract ET-78-S-05-5912)
(DOE-ET-20071/T1; QR-3) Avail: NTIS HC A03/MF A01

Research continued on tropical grasses from Saccharum and related genera as sources of intensively propagated fiber and fermentable solids. Candidate screening (for short rotation grasses) was expanded to include six sorghum x Sudan grass hybrids developed by the Dekalb Company. Incomplete data indicate that two of the new grasses might be comparable to the NK hybrids in total biomass production and drought tolerance. Sugar-cane and napier grass yield trends in year 3 includes: (1) increased yields with delay of harvest frequency; (2) lack of response to close spacing; (3) a superiority of napier grass over sugarcane when harvested at intervals of six months or less; and (4) a general superiority of the sugarcane variety NCo 310 over varieties PR 980 and PR 64-1791. Delayed tasseling of a wild, early flowering S spontaneous hybrid enabled three crosses to be made in December using commercial hybrids as female parents. Approximately 1000 seedlings were produced. FIRST REPORT TO CONGRESS ON THE USE OF ALCOHOL IN MOTOR FUELS Annual Report
1 Apr. 1980 62 p
(DOE/CS-0165; AR-1) Avail: NTIS HC A04/MF A01

The following information is presented: (1) a description of the firms engaged in the alcohol fuel industry; (2) the amount of alcohol fuels sold in each state and the amount of gasoline saved in each state by reason of the use of alcohol fuels; (3) the revenue loss resulting from the exemptions from tax for alcohol fuels; and (4) the cost of production and the retail cost of alcohol fuels as compared to gasoline and special fuels before the imposition of any Federal excise tax. During 1979, a rapid increase in marketing of alcohol fuel, specifically the 10% blend known as gasohol, has caused a significant gap between the motor fuel marketplace and the information system(s) that compile a consistent data base for domestic energy production and consumption. MODIFICATIONS FOR USE OF METHANOL OR METHANOL-GASOLINE BLENDS IN AUTOMOTIVE VEHICLES Technical Report, Sep. 1970 - Jan. 1980

D. J. Patterson, J. A. Bolt, and D. E. Cole Jan. 1980 194 p refs

(Contract DE-AC04-76CS-53682)

(ALO-3682-T1) Avail: NTIS HC A09/MF A01

Potential problems in the use of methanol or blends of methanol and gasoline as automotive fuels are examined. Retrofitting of existing vehicles as well as future vehicle design is considered. Several potentially serious problems are identified with methanol use. The most attractive solutions depend upon an integrated combination of vehicle modifications and fuel design. No vehicle problems are found which could not be solved with relatively minor developments of existing technology providing the methanol or blend fuel was itself engineered to ameliorate the solution. Research needs are identified in the areas of lubrication and materials. Because of the substantial costs and complexities of a retrofitting program, use of methanol must be evaluated in relation to other petroleum saving alternatives. Future vehicles can be designed initially to operate satisfactorily on these alternate fuels. However a specific fuel composition must be specified around which the future engines and vehicles can be designed. DOE

MODELING AND EVALUATION OF DESIGNS FOR SOLID HYDROGEN STORAGE BEDS

P. W. Fisher and J. S. Watson 1980 11 p refs Presented at the 3d World Hydrogen Energy Conf., Tokyo, 23-26 Jun. 1980

(Contract W-7405-eng-26)

(CONF-800616-8) Avail: NTIS HC A02/MF A01

Mathematical models were developed to predict the performance of metal hydride beds used for hydrogen storage. The relative importance of heat transfer, mass transfer, chemical kinetics, and equilibrium were evaluated through comparison of the models with experimental data supplied by Brookhaven National Laboratory for a cylindrical bed containing FeTi alloy. An equilibrium model containing no empirical parameters produced bed pressure and temperature which showed good agreement with experimental data. This model was used to evaluate two proposed designs for solid hydrogen storage beds in which (1) FeTi alloy was contained in tubes that were externally cooled, and (2) FeTi alloy was contained in a bed that were penetrated by cooling tubes. The model predicts that heat transfer surface area is utilized most effectively with the second cooling configuration. DOE

COAL DEMONSTRATION PLANTS Quarterly Report, Apr. - Jun. 1979

Apr. 1980 75 p

(DOE/FE-0004/79-2) Avail: NTIS HC A04/MF A01

Second generation technologies were demonstrated. The economic, environmental and productive capacity of a near commercial-size plant were validated by integrating and operating a modular unit using commercial size equipment. These facilities were aimed at accelerating and reducing the risks of industrial process implementation. Contracts for the design, construction, and operation of the demonstration plants were awarded through competitive procedures and were cost shared with the industrial partner. The government share of the cost involved for a demonstration plant depends on the plant size, location, and the desirability and risk of the process to be demonstrated. The various plants and programs are discussed: description and status, funding, history, flowsheet and progress during the current quarter. DOE

KINETICS AND MECHANISMS OF CATALYTIC HYDROLIQUEFACTION AND HYDROGASIFICATION OF LIGNITE Quarterly Report, Jan. - Mar. 1980

Alvin H. Weiss, Wilmer L. Kranich, and Kemal Gueruez 20 Apr. 1980 29 p

(Contracts DE-AS01-77ET-10618)

(FE-2702-10) Avail: NTIS HC A03/MF A01

Delay in the delivery of a new pump prevented expansion of the range of flow rates already studied on lignite liquefaction in the continuous stirred tank reactor. Data previously reported have been refined and for the most part confirmed. Agitator speed does not affect reaction rate over the range of speeds used in experimental runs, but hydrogen pressure appears to exert an influence particularly at higher temperatures. A new batch reactor was put into operation which is expected to yield valuable catalyst screening and kinetic data. Successful design, fabrication, and operation of a fast-feed mechanism should greatly reduce the long preheating times which obscure the kinetic results of most batch studies. DOE

ADVANCED COAL GASIFICATION SYSTEM FOR ELECTRIC POWER GENERATION Quarterly Progress Report, 1 Oct. - 31 Dec. 1979

L. A. Salvador 25 Jan. 1980 74 p

(Contracts DE-AC01-76ET-10161; EF-77-C-01-1514)

(FE-1514-113; QPR-1) Avail: NTIS HC A04/MF A01

The results of gasification process development tests are reported. A review of the data and the effect of various modifications on cyclone deposits was conducted. It is tentatively concluded that the mechanism of deposit formation is the result of sticky particles or liquid droplets out of the combustion and/or gasification zone impacting on the hot refractory cyclone walls as a result of change in direction of flow. A water spray nozzle was installed in the freeboard area of the gasifier to quench particles with a liquid film and render them nonsticky. Water spray was also used to cool the gas and particles from 1800 F to 1300 F. At this temperature, the deposit was practically eliminated. However, long-duration tests with Pittsburgh seam and Ohio No. 9 coals are necessary before any firm conclusions can be drawn about the effect of water spray. Significant progress was made in the construction of the cold-flow, scale-up facility. In addition, studies were made on the reactivity of various chars in the laboratory fluidized bed. DOE

FUSION REACTORS FOR HYDROGEN PRODUCTION VIA ELECTROLYSIS
J. A. Fillo, J. R. Powell, and M. Steinberg 1979 7 p refs Presented at the 2d Intern. Conf. on Alternative Energy Sources, Miami Beach, Fla., 10-13 Dec. 1979
(Contract DE-AC02-76CH-00016)
(BNL-27782; CONF-791204-37) Avail: NTIS HC A02/MF A01

The decreasing availability of fossil fuels emphasizes the need to develop systems which will produce synthetic fuel to substitute for and supplement the natural supply. An important first step in the synthesis of liquid and gaseous fuels is the production of hydrogen. Thermonuclear fusion offers an inexhaustible source of energy for the production of hydrogen from water. Depending on design, electric generation efficiencies of approximately 40 to 60% and hydrogen production efficienceis by high temperature electrolysis of approximately 50 to 70% and projected for fusion reactors using high temperature blankets. (Contract DE-AC04-76DP-00789)
(SAND-80-0123) Avail: NTIS HC A04/MF A01

Neutron activation of American Cyanamid 1442A CoMo catalyst was employed to tag a one day's charge of catalyst in H-Coal PDU run no. 9. The activity of Co-60 in the withdrawals has shown that 8 days are required to uniformly distribute a daily addition of catalyst in the bed during PDU run no. 9. Catalysts used in the LC-Fining of SRC-1 show aging characteristics similar to H-Coal catalyst: 20 to 30 w/o organic contamination, 2 to 5 w/o inorganic contamination, 50 percent loss of surface area, and changes in pore volume distributions. Elemental distribution of contaminants indicate that the catalysts are extremely efficient metals scavengers, with titanium and iron major contaminants penetrating 200 micrometers into the catalysts. A mechanistic pathway for coal liquefaction were experimentally verified by the combination of low temperature (25 to 300 C) batch reaction data in inert atmospheres, high temperature-moderate pressure reaction data (500 psi H2) from tubing reactors at 400 and 426 C, and high pressure (2000 psi H2) data collected in a continuous reactor at 400, 425, and 450 C. (Contract EG-77-C-02-4388)
(COO-4388-11; Dynatech-2013; PR-11) Avail: NTIS HC A03/MF A01

It was found that marine algae could be converted to higher aliphatic organic acids and these acids can be converted to aliphatic hydrocarbons, which may be used as a diesel fuel. A coenzyme M analogue, 2-bromoethanesulfonic acid, was shown to be an effective suppressor of methane in nonsterile anaerobic fermentation of cellulosic substrates. An analysis of the energy outputs and requirements for the production of liquid hydrocarbon fuel from corn was performed. An analytical scheme for determining composition of biomass materials was devised. A tapered auger device was designed and built which was demonstrated on the bench to be effective for adding substrate and removing residue in a continuous manner from a fixed packed bed fermenter. A solvent extractor system using kerosene as the nonaqueous phase was constructed and is currently in operation in series with the 300 liter fixed packed bed fermenter. The electrolytic oxidation of organic acids produced in the 300 liter fixed packed bed fermenter is operating with a favorable energy balance of 6/1 based on the applied potential. DOE

CALIFORNIA'S BIOMASS AND ITS ENERGY POTENTIAL Ph.D. Thesis
Frank Bart Lucarelli, Jr. Apr. 1980 317 p refs
(Contract W-7405-eng-48)
(LBL-10058) Avail: NTIS HC A14/MF A01

Estimates of the costs of transforming biomass into different fuels as well as a survey of government's role in a biomass energy program are presented. The major findings are summarized below. (1) California's existing biomass resources are sufficient to provide only 20 percent of its future liquid fuel requirements. (2) Meeting the full transportation demand with biomass derived fuels will require the development of exotic biomass sources such as kelp farms and significant reduction in automobile travel in the State. (3) Under assumptions of moderate increases in gasoline prices and without major new government incentives, the cost of transforming biomass into transport fuels will be competitive with the price of gasoline on a Btu basis by the year 1990. (4) The environmental impacts of collecting most forms of biomass are beneficial and should reduce air pollution from agricultural burning and water pollution from feedlot and dairy farm runoff. DOE

ECONOMICS OF SHALE OIL PRODUCTION BY RADIO FREQUENCY HEATING
Richard G. Mallon 7 May 1980 11 p refs
(Contract W-7405-eng-48)
(UCRL-52942) Avail: NTIS HC A02/MF A01

A conceptual facility for the production of shale oil by radio frequency (rf) heating was designed to evaluate the economic feasibility of this technique. The shale was processed in situ without being rubbed or explosively fractured. Metal electrodes inserted in a set of vertical drill holes were energized by a group of rf oscillators. The electric field was developed in such a way that heating within the block was almost uniform, and heating outside the block was very low. The facility schedule is planned so that off-peak electric power from existing generating stations is used to operate the oscillators. The two principal costs are purchase of electric power and mining operations. The largest capital requirement is oscillators and associated electrical equipment. DOE

INVESTIGATION OF MECHANISMS OF HYDROGEN TRANSFER IN COAL HYDROGENATION, PHASE 2 Annual Report, Jan. - Dec. 1978
D. C. Cronauer, R. O. Ruberto, and D. C. Young May 1979 110 p refs
(Contract EX-76-C-01-2305)
(FE-2305-30) Avail: NTIS HC A06/MF A01

An understanding of the mechanism of hydrogen transfer to coal and its intermediates during liquefaction was developed. Results of experiments with coal and asphaltenes are consistent with those of the model compounds, and the knowledge of both phases were combined. Coal primarily cracks in linkages between aromatic type units such that transferred hydrogen exists on carbons alpha to an aromatic ring. The coal free-radicals abstract hydrogen from any available source such as hydroaromatics, naphthenes, alkyl aromatics and dissolved hydrogen, in roughly that order. Solvent losses through adduction and isomerization were significant, and lead to decreased activity or effectiveness of recycled solvents. The use of nmr gives an improved understanding of the mechanism of reactions involved in the liquefaction of coal. DOE

DEVELOPMENT OF NEW CATALYSTS FOR COAL LIQUID REFINING Quarterly Report, 1 Jan. - 31 Mar. 1980
Apr. 1980 28 p refs
(Contracts DE-AC01-78ET-12103; FT-78-C-01-2595)
(FE-2595-5; QR-5) Avail: NTIS HC A03/MF A01

The first series of cracking catalysts formulated with 20% exchanged Na-Y zeolite, and 80% matrix binder was activity tested with a hydrotreating SRC-2 Fuel Oil Blend. The best results were obtained with a rare earth exchanged zeolite. An improved catalyst for hydrotreating SRC-2 Fuel Oil Blend was prepared from a nickel molybdate impregnated Kaiser alumina. Synthesis and characterization of various catalytic components and cation exchange of these materials is complete. DOE

ADVANCED SYNFUELS PRODUCTION/POWER SYSTEMS UTILIZING LASER PARTICULATE CONTROL
T. Botts, Jr., J. R. Powell, and J. A. Fillo 1979 4 p refs
Presented at the 2d Miami Intern. Conf. on Alternative Energy Sources, Miami Beach, Fla., 10-13 Dec. 1979
(Contract DE-AC02-76CH-00016)
(BNL-27783; CONF-791204-38) Avail: NTIS HC A02/MF A01

Coal fired turbines offer an attractive means of generating electrical power using an available resource and near term technologies. However, in order to maintain adequate turbine blade lifetimes, and thus make such plants economically attractive, better means of hot gas clean up than those presently available are needed. One possible solution to this problem is the use of intense laser beams to augment the conventional body forces in cyclones to increase collector efficiencies for smaller sized particulates. Finally, plant factors can be increased by means of alternate energy utilization during offpeak periods. One such scheme is to raise steam and perform high temperature electrolysis. It appears as if the hydrogen produced is more useful as a transportable fuel or chemical than as a means of energy storage. DOE

AUTOMOTIVE FUELS FROM CELLULOSE MATERIALS Final Report
B. Higginson and R. H. Thornton Jan. 1980 28 p refs
(NZERDC-49; ISSN-0110-1692) Avail: NTIS HC A03/MF A01

The results of this investigation showed that it was feasible to link the alcohol fermentation and anaerobic digestion processes into a system for the production of both alcohol and methane from organic substrates. Although optimization of fermentation was attempted with due regard to energy conservation, for industrial application the cost of sugar will be the overriding factor. A hydraulic retention time of 10 days or longer was needed for effective digestion in which a reduction of chemical oxygen demand of up to 85% was achieved. Results indicated that further reduction in retention time may be possible if the microbial biomass could be either retained on support media, or recycled more effectively. A gas production rate of 4270 liters gas/cubic meter culture/day at 11.6 day retention time was obtained with the anaerobic contact digester using fodder beet spent wash. Using the same substrate, results over short periods with the anaerobic filter system could produce up to 4.8 liters gas/litre culture/day. The high methane composition of this gas (75 to 80%) make this an attractive proposition. DOE

ASSESSMENT OF SYNTHANE MECHANICAL EQUIPMENT
J. T. McCabe, F. E. Kramberger, B. R. Hao, D. Dubis, and S. E. Carson May 1980 164 p refs
(Contract DE-AC01-77ET-10622)
(MTI-79TR5) Avail: NTIS HC A08/MF A01

Mechanical equipment in the Synthane pilot plant was subjected to operating conditions outside manufacturers' specifications. In some cases, these encounters were intentional and in other cases they resulted from insufficient data. All 106 of the test runs were terminated involuntarily. For the most part, the repetitive failures of plant materials and equipment originated from a combination of excessive solids overloading and corrosion/erosion caused by abnormal conditions of operation on fluid process streams. The extremes of these conditions were not anticipated nor were they taken into consideration in the design of the plant and in the selection of equipment and materials. Because of this situation, approximately half of the test run terminations were directly attributed to mechanical failures. Generally, for reasons given the maintenance, repair or replacement of failed equipment was not successful in eliminating or alleviating many failures until early 1978. Appropriate early planning can eliminate all these causes of failure in the future. DOE

FLASH PYROLYSIS AND GASIFICATION OF COAL THROUGH LASER HEATING

W. H. Beattie and J. A. Sullivan 1980 6 p refs Presented at 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 18-22 Aug. 1980
(Contract W-7405-eng-36)
(LA-UR-80-1094; CONF-800806-28) Avail: NTIS HC A02/MF A01

Experimental results obtained from the rapid pyrolysis of finely powdered coal are presented. The experiments are designed to provide basic information on gas yield, gas composition, optimum fluxes, and temperature history of coal samples under high intensity laser radiation. The information obtained from these experiments is used to test concepts for the use of concentrated sunlight to produce fuel gases from coal. Heating the coal at rates of 1000 to 10,000 C/s in an inert atmosphere of argon results in pyrolysis at temperatures between 400 and 800 deg C. The gases evolved are primarily CO, H2, and CH4 with lesser amounts of CO2 and other light hydrocarbons. Mass spectrometry is used to determine the composition of the evolved gases. The optimum flux for laser pyrolysis of coal was found to be 250w /sq cm. Results from experiments wherein the char created by pyrolysis is gasified to CO in an atmosphere of CO2 are also presented. COAL LIQUEFACTION Quarterly Report, Apr. - Jun. 1979
Apr. 1980 65 p
(DOE/FE-0003/79-2) Avail: NTIS HC A04/MF A01

Current work is aimed at improved process configurations for both catalytic and non catalytic processes to provide more attractive processing economics and lower capital investment. The advantage of coal liquefaction is that the entire range of liquid products, especially boiler fuel, distillate fuel oil, and gasoline, can be produced from coal by varying the type of process and operating conditions used in the process. Furthermore coal derived liquids have the potential for use as chemical feedstocks. To provide efficient and practical means of utilizing coal resources, DOE is supporting the development of several conversion processes that are currently in the pilot plant stage. DOE

THERMODYNAMIC PROPERTIES OF LIQUEFIED PETROLEUM GASES (LPG) Interim Report, 15 Aug. 1975 - 31 Jan. 1977
Dirse W. Sallet and K. F. Wu Apr. 1980 111 p refs
(Contract DOT-FR-64181)
(PB80-189053; FRA/ORD-76/299) Avail: NTIS HC A06/MF A01 CSCL 21D

The thermodynamic properties of several liquefied petroleum gases (with particular emphasis on propane) are discussed in detail. Thermodynamic data for four liquefied petroleum gases were calculated and are presented in tabular form. Predictors of pure propane mass flow rates (based upon isentropic) homogeneous equilibrium flow are given. The influence of the thermodynamic data upon the predicted mass flow rates was demonstrated. THE CALCULATION OF THE THERMODYNAMIC PROPERTIES OF PROPANE, PROPYLENE, N-BUTANE, AND ETHYLENE Final Report, 31 Jan. 1977 - 31 May 1978
Dirse W. Sallet and Milton E. Palmer Apr. 1980 167 p refs
(Contract DOT-FR-64181)
(PB80-189061; FRA/ORD-76/300) Avail: NTIS HC A08/MF A01

The thermodynamic properties of propane, propylene, n-butane and ethylene were calculated and are presented in tables. The tables list the values of the specific volume, the enthalpy, the entropy, the specific heat at constant pressure, the specific heat at constant volume and the sonic velocity of the four hydrocarbons in a temperature and pressure range which can be encountered when these commodities are shipped by rail tank cars. This includes subcooled states, saturation equilibirum states and superheated states. The computer program with which the tables were generated is discussed in detail and a complete listing of the program is given. GRA

BIOMASS ENERGY PRODUCTION. CITATIONS FROM THE INTERNATIONAL AEROSPACE ABSTRACTS DATA BASE Progress Report, 1975 - Apr. 1980
Peter W. Moore Jun. 1980 58 p Sponsored in cooperation with NASA and NTIS
(PB80-810807; NASA-CR-163595) Avail: NTIS HC $30.00/MF $30.00 CSCL 21D

These 210 citations from the international literature describe the production and/or utilization of most forms of biomass as a source of energy, fuel, food, and chemical intermediates or feedstocks. Biomass conversion by incineration, gasification, pyrolysis, hydrolysis, anaerobic digestion, or fermentation, as well as by catalytic, photosynthetic, chemosynthetic, and bioelectrochemical means are among the conversion processes considered. Discussions include biomass plantation and material productivity, transportation and equipment requirements, effects, comparisons of means and efficiencies of utilization and conversion, assessments of limitations, and evaluations of economic potential. US-Patent-Class-367-57) Avail: US Patent and Trademark Office CSCL 08M

Data for use in producing a tomograph of subsoil structure between boreholes is derived by pacing spaced geophones in one borehole, on the Earth surface if desired, and by producing a sequence of shots at spaced apart locations in the other borehole. The signals, detected by each of the geophones from the various shots, are processed either on a time of arrival basis, or on the basis of signal amplitude, to provide information of the characteristics of a large number of incremental areas between the boreholes. Such information is useable to produce a tomograph of the subsoil structure between the boreholes. By processing signals of relatively high frequencies, e.g., up to 100 Hz, and by closely spacing the geophones, a high resolution tomograph can be produced.

LIQUID IMMERSION APPARATUS FOR MINUTE ARTICLES Patent Application
Jewell G. Belcher and Ben R. Hollis, inventors (to NASA) Filed 18 Jul. 1980 9 p
(NASA-Case-MFS-25363-1; US-Patent-Appl-SN-171933) Avail: NTIS HC A02/MF A01 CSCL 13H

An apparatus for immersing minute articles such as integrated circuit chip in an etching solution during manufacture of the chips is described. The apparatus includes a basket having minute fluid passages in its sides and bottom, the passages being dimensioned to overcome buoyancy while allowing complete circulation. The basket has a removable lid member also having fluid passages to prevent air pockets and facilitate circulation. Both the basket and lid member are constructed of corrosion resistant material such as Teflon and are dimensional to provide a friction bit. A holder member including handle portion and support mean is disposed to support and retain the basket while in the solution. The overall combination of the basket, lid, and handle having the features referred to above enable treatment of the chips and avoidance of losses and unnecessary handling. E.D.K.

COUPLED WAVE MODEL FOR LARGE MAGNET COILS Final Report
G. J. Gabriel Sep. 1980 53 p refs
(Grant NsG-3182)
(NASA-CR-3332; E-535) Avail: NTIS HC A04/MF A01 CSCL 09C

A wave coupled model based on field theory is evolved for analysis of fast electromagnetic transients on superconducting coils. It is expected to play a useful role in the design of protection methods against damage due to high voltages or any adverse effects that might arise from unintentional transients. The significant parameters of the coil are identified to be the turn to turn wave coupling coefficients and the travel time of an electromagnetic disturbance around a single turn. Unlike circuit theoretic inductor, the coil response evolves in discrete steps having durations equal to this travel time. It is during such intervals that high voltages are likely to occur. The model also bridges the gap between the low and high ends of the frequency spectrum. Author

PERMANENT DEFORMATION OF FLEXIBLE PAVEMENTS Final Technical Report, Sep. 1978 - Jun. 1980
S. F. Brown, B. V. Broderick, and J. W. Pappin Jun. 1980 165 p refs
(Grants DA-ERO-78-G-114; DA-ERO-77-G-061;

DA Proj. 1T1-61102-BH-57)
(AD-A087859) Avail: NTIS HC A08/MF A01 CSCL 13/2

Seven pairs of pavements with granular bases were tested under controlled conditions. One pavement in each pair contained fabric inclusions. An improved testing facility was developed, including: (1) servo-hydraulic system for the loading carriage; (2) amplification and read-out system for pressure cells; (3) linearizing unit for strain coils; (4) transducers for measuring vertical and resilient deflection; (5) techniques for measuring in situ strain on fabric inclusions; (6) extensive use of nuclear density meter to monitor pavement and foundation materials. The following conclusions are drawn: (1) No improvement in performance resulted from fabric inclusions. (2) No consistent reduction in in-situ stresses, resilient strains, or permanent strains was observed as a result of fabric inclusion. (3) No consistent improvement in densities resulted from fabric inclusions. (4) Some slip apparently occurred between fabric and soil on those pavements which involved large deformations. The slip occurred between fabric and crushed limestone base rather than between fabric and silty-clay subgrade. GRA

MATHEMATICAL MODEL TO CORRELATE FROST HEAVE OF PAVEMENTS WITH LABORATORY
R. L. Berg, G. L. Guymon (California Univ., Irvine), and T. C. Johnson Feb. 1980 56 p refs Sponsored in part by FAA and Federal Highway Administration
(DA Proj. 4A7-62730-AT-42)
(AD-A084737; CRREL-80-10) Avail: NTIS HC A04/MF A01 CSCL 08/12

A mathematical model of coupled heat and moisture flow in soils was developed. The model includes algorithms for phase change of soil moisture and frost heave and permits several types of boundary and initial conditions. The finite element method for weighted residuals (Galerkin procedure) was chosen to simulate the spatial regime and the Crank-Nicholson method was used for the domain portion of the model. To facilitate evaluation of the model, the heat and moisture fluxes were essentially decoupled; moisture flux was simulated accurately, as were heat flux and frost heave in a laboratory test. Comparison of the simulated and experimental data illustrate the importance of unsaturated hydraulic conductivity. It is one parameter which is difficult to measure and for which only a few laboratory test results are available. Therefore, unsaturated hydraulic conductivities calculated in the computer model may be a significant source of error in calculations of frost heave. The algorithm incorporating effects of surcharge and overburn was inconclusively evaluated. Time-dependent frost penetration and frost heave in laboratory specimens were closely simulated with the model. L.F.M.

CONVENTIONAL MACHINING OF ESR 4340 STEEL Final Report, 1 Sep. 1978 - 1 Apr. 1980
K. K. Niji Jul. 1980 118 p
(Contract DAAG46-78-C-0046)
(AD-A088451; HH-80-125; USAAVRADCOM-TR-80-F-14; AMMRC-TR-80-34) Avail: NTIS HC A06/MF A01 CSCL 13/8

This program involved the study of conventional machining of heat treated ESR 4340 steel (Rc 54-57). Initial effort involved a survey of available data regarding the machining of high strength steels with hardnesses of Rc 50 and above. A machining program was conducted, determining optimum tools and conditions for turning, drilling, face milling, end milling, and grinding operations. Effects of various parameters includng cutting speeds, feeds, depths of cut, and cutting fluids on tool life was determined. All the operations were found to be extremely difficult and applicaton of conventional procedures is not feasible. Tool lives remained short despite reductions in speeds and feeds. Conventional grinding methods induced detrimental residual tensile stresses along the surface, resulting in cracking, lapping, and untempered martensitic structures. Low stress grinding techniques were found to be applicable to this material when proper dressing procedures and reduced rates were used. GRA

AIR CUSHION CRAFT DEVELOPMENT, FIRST REVISION Final Report
Peter J. Mantle Jan. 1980 525 p refs
(AD-A084740; DTNSRDC-80/012-Rev-1) Avail: NTIS HC A22/MF A01 CSCL 13/10

The development of air cushion craft from their inception to the present day is described. Both aerostatic craft known as air cushion vehicles and surface effect ships as well as aerodynamic craft such as wing-in-ground effect vehicles are covered. The various available theories, empirical laws, and experimental data were brought together and expressed in unified form. Emphasis is given to reducing the data and analysis to their simplest forms for easy understanding and isolation of fundamental parameters. Currently operational craft, those still in their construction jigs, or in some cases those still on the drawing board are assessed and compared to the basic theories to give a measure of the state-of-the-art. Such topics as performance, propulsion, ride quality, and high speed aerodynamic craft are included. R.K.G.

ANALYTICAL MODELING OF THE HOT ISOSTATIC PRESSING PROCESS Final Report, 15 Jul. 1978 - 14 Jul. 1980
Brice N. Cassenti and K. J. Cheverton Jul. 1980 134 p refs
(Contract F49620-78-C-0090; AF Proj. 2307)
(AD-A088208; R80-944374-13; AFOSR-80-0592TR) Avail: NTIS HC A07/MF A01 CSCL 13/8

This report describes the results of a two-year investigation to develop a modeling strategy to predict the final shape of components manufactured by the Hot Isostatic Pressing (HIP) process. When a powder metal is subjected to the high pressures at high temperatures there is a permanent reduction in the macroscopic volume by approximately 30 percent. The volume reduction, which is not included in classical creep and plasticity theories, necessitates the modification of the classical theories. The major part of this report concerns development of a constitutive model for powder metals. A model for powder metals subjected to an external hydrostatic pressure has been developed and compares well with experimental results. The exact form of the theory for a multi-axial stress state was determined by a series of mechanical tests. The constitutive model has been incorporated into the MACR nonlinear finite element computer program and analysis of an independent experiment using the modified code has been performed and verified the accuracy of the theory. Once the theory had been verified it was applied to the HIP of a disk and a sensitivity study was performed to determine an efficient modeling strategy. The results of the program are discussed in detail. GRA

EFFECTS OF ENERGY-EFFICIENT VENTILATION RATES ON INDOOR AIR QUALITY AT AN OHIO ELEMENTARY SCHOOL
J. V. Berk, R. Young, C. D. Hollowell, I. Turiel, and J. Pepper. Apr. 1980. 68 p. refs.
(Contract W-7405-eng-48)
(LBL-10223; EEB-Vent-80-9) Avail: NTIS HC A04/MF A01

A mobile laboratory was used to monitor air outdoors and at three indoor sites (two classrooms and a large multipurpose room); tests were made at three different ventilation rates. The parameters measured were outside air flow rates, odor perception, microbial burden, particulate mass, total aldehydes, carbon dioxide, ozone, and nitrogen oxides. The results of these measurements are given and compared with the existing outdoor air quality standards. Carbon dioxide concentrations increased as the ventilation rate decreased, but still did not exceed current standards. Odor perceptability increased slightly at the lowest ventilation rate. Other pollutants showed very low concentrations, which did not change with reductions in ventilation rate. DOE

MAGNETIC REFRIGERATION FOR SPACE APPLICATIONS
J. A. Barclay and W. A. Steyert. 1980. 6 p. refs. Presented at the 8th Intern. Cryog. Eng. Conf. Genoa, 3 Jun. 1980.
(Contract W-7405-eng-36)
(LA-UR-80-1566; CONF-800631-7) Avail: NTIS HC A02/MF A01

Magnetic refrigeration is briefly analyzed and thermodynamically compared to gas refrigeration. The characteristics of magnetic refrigerators with respect to spacecraft applications are discussed. High reliability coupled with high efficiency is possible. Results on several wheel and reciprocating magnetic refrigerators are summarized. DOE

EXPLOSIVE DEMOLITION OF ACTIVATED CONCRETE
D. L. Smith. 1980. 16 p. Presented at the Concrete Decontamination Workshop, Seattle, 28 May 1980.
(Contract DE-AC07-76ID-01570)
(CONF-800542-4) Avail: NTIS HC A02/MF A01

This paper describes the removal of a radiologically contaminated concrete pad. This pad was removed during 1979 by operating personnel under the direction of the Waste Management Program of EG and G Idaho, Inc. The concrete pad was the foundation for the Organic Moderated Reactor Experiment (OMRE) reactor vessel. The pad consisted of a cylindrical concrete slab 15 ft in diameter, 2 ft thick, and reinforced with steel bar. It was poured directly onto basalt rocks approximately 20 ft below grade. The entire pad contained induced radioactivity and was therefore demolished, boxed, and buried rather than being decontaminated. The pad was demolished by explosive blasting.

THERMODYNAMIC PROPERTIES OF SOLID HELIUM USING AN ANHARMONIC ANISOTROPIC CONTINUUM MODEL. Ph.D. Thesis
Terrell Dunlap Berker. 1980. 106 p. refs.
(Contract DE-AC02-76ER-01198)
(DOE/ER-01198/1314) Avail: NTIS HC A06/MF A01

An anharmonic anisotropic continuum model is used to describe the thermodynamic properties of solid helium for all three structures (hcp, fcc, and bcc) and both isotopes. Using a 6-n potential with the de Boer value for the attractive parameter, the two repulsive parameters b sub n and n are varied to obtain a best fit to experimental hcp HE4 data. The n = 11 potential gives good volume dependence over the entire experimentally accessible volume range, but too large an isotope effect. The n = 10 potential gives a better mass dependence, but a less satisfactory volume dependence. A detailed comparison of the calculations with experimental data shows that while it is possible to fit the volume dependence of the pressure, bulk modulus, and Debye temperature over a very wide range, the model overestimates the zero point contribution to the free energy. The conclusion is reached that the major discrepancies obtained result from the failure of the continuum model to take account of dispersion. This failure can be remedied by artifically endowing the continuum with dispersion. A program for the further development of the model is outlined. DOE

METROLOGY DATA REDUCTION SYSTEM: PDP-11/34 COMPUTER SYSTEM
J. W. Cable. Apr. 1980. 48 p. refs.
(Contract DE-AC04-76DP-00613)
(BDX-613-2402) Avail: NTIS HC A03/MF A01

A PDP 11/34 computer system was installed to acquire, correct, scale, display, store, and process data obtained by microwave and dc area coupler controllers. The system is used to calibrate power sensors and impedance and dc measurement standards on a real time basis. The microwave data input is from a digital voltmeter and scanner arrangement, which also may be controlled from a P-ROM control board. The dc data input is from a passive device interface or from a terminal keyboard. DOE

INVESTIGATION OF FATIGUE FAILURE IN BITUMINOUS BASE MIXES. Final Report
G. W. Maupin, Jr. Feb. 1980. 27 p. refs.
(PB80-188006; VHTRC-80-R36; FHWA/VA-80/36) Avail: NTIS HC A03/MF A01 CSCL 13D

A correlation between the results obtained with the fatigue test and those from the indirect tensile test on two base mixes was attempted in anticipation of the possible use of the latter test to design base mixes for maximum fatigue life. Two base mixes at several asphalt contents were tested at two test temperatures. Flexural fatigue tests and indirect tensile tests were performed for each mix and temperature condition. The asphalt content corresponding to the maximum fatigue life agreed generally with the asphalt content corresponding to maximum work in the indirect tensile test. The work computed from the indirect tensile test is useful in selecting the asphalt content for the maximum fatigue life of base mixes. GRA

ALTERNATIVE HIGHWAY DEICING CHEMICALS. EXECUTIVE SUMMARY. Final Report, Jul. 1976 - Oct. 1979
Stanley A. Dunn and Roy U. Schenk. Mar. 1980. 20 p. refs.
(Contract DOT-FH-11-9100)
(PB80-193634; FHWA/RD-79/109) Avail: NTIS HC A02/MF A01 CSCL 13B

A search was made for road deicing chemicals to replace sodium chloride (NaCl). Two candidate deicers were found to be as effective as sodium chloride. One, methanol, reacts almost immediately upon contact with snow and ice but is less persistent than NaCl. The other calcium magnesium acetate (CMA), acts at about the same rate as NaCl in the temperature range of common activity and shows about the same persistence. It gives rise to about the same decreases in coefficients of braking traction and skidding friction as NaCl. CMA is a corrosion inhibitor, is beneficial to most soils and has no potential for harming drinking supplies. The unpurified CMA derived from solid wastes, primarily cellulose, gives improved traction and reduces production costs.

THE EFFECT OF COMPACTED PRESTRESS ON COMPACTED SHALE COMPRESSIBILITY Interim Report
G. R. Witsman and C. W. Lovell. 5 Sep. 1979. 199 p. refs. Sponsored by Indiana State Highway Commission.
(PB80-191158; JHRP-79-16; FHWA/IN/JHRP-79/16; IR-6) Avail: NTIS. HC A09/MF A01. CSCL 08M.

The compressibility of the compacted New Providence Shale was studied as a function of the compaction variables, viz., water content, compactive foot pressure, compaction effort, and compacted density. All samples were compacted in the kneading device to simulate low, standard and modified impact energy levels. All compression and/or heave was one dimensional. Compactive prestress was found to increase with compaction pressure and to decrease with compaction water content. To simulate the effects of the service environment, compacted samples were confined and saturated with measurements, of volume change. Such changes were either increases (heave) or decreases (settlement or collapse). The prediction equations developed are of the type needed to predict settlement of heaves within compacted shale embankments in service. GRA

PAVEMENT AND GEOMETRIC DESIGN CRITERIA FOR MINIMIZING HYDROPLANING. A TECHNICAL SUMMARY Final Report
D. M. Gallaway, G. G. Hayes, D. L. Ivey, W. B. Ledbetter, R. M. Olson, H. E. Ross, Jr., R. E. Schiller, Jr., and D. L. Woods. Dec. 1979. 111 p. refs.
(Contract DOT-FH-11-8269)
(PB80-190457; FHWA/RD-79/30) Avail: NTIS. HC A06/MF A01. CSCL 13B.

The empirical indications of hydroplaning as determined from hard data were covered. Precise measurements of surface drainage were examined, and equations relating pavement texture and cross slope and rainfall intensity were developed. Vehicle control as related to variation in cross slope was simulated with the HVOSM simulation model. A determination of the deficiencies in existing surface drainage design methodology for sag vertical curves was conducted, and innovative solutions to these problems are presented. From a detailed study of state rainfall records a method is presented for determining a design rainfall intensity. Field studies of open graded friction courses included water depths in simulated and natural rainfall, the effects of tire type, tread depth, inflation pressure, vehicle speed, and accumulated traffic. GRA

MULTIPLE BAND CIRCULARLY POLARIZED MICROSTRIP ANTENNA Patent
I-Ping Yu, inventor (to NASA) (Lockheed Electronics Co., Houston, Tex.) Issued 19 Aug. 1980. 7 p. Filed 22 Jun. 1979. Supersedes N79-27348 (17 - 18, p. 2393). Sponsored by NASA.
(NASA-Case-MSC-18334-1; US-Patent-4,218,682; US-Patent-Appl-SN-051270; US-Patent-Class-343-700MS; US-Patent-Class-343-830) Avail: US Patent and Trademark Office. CSCL 09C.

A multiple antenna assembly for communicating electromagnetic radiation is disclosed. An antenna element stack is constructed of a plurality of elliptical lamina antenna elements mutally separated by layers of dielectric material, and separated from a ground plane by dielectric material. The antenna assembly is coupled through a feed line in contact with the top antenna element. A conductor joins the remaining antenna elements to the ground plane. Each individual antenna element is operable for communication reception and transmission within a frequency band determined by the size of the particular antenna element. The sizes of the antenna elements may be selected to provide electromagnetic radiation communication over several distinct frequency bands, or to connect the individual bands into a broad band.

TRANSMISSION OF 565 Mbit/s SIGNALS VIA COAXIAL CABLES
Helmut Bauch, Hans G. Jungmeister, and Karl Heinz Moehrmann. Jan. 1980. 14 p. refs. Transl. into ENGLISH from NTZ-Nachrtech. Z. (West Germany), v. 32, no. 9, 1979. p. 608-612.
(BLL-RDL-Trans-3793-(7737.470)) Avail: British Library Lending Div., Boston Spa, Engl.

A high bit rate transmission system which utilizes coaxial cables is described. In this installation the intermediate regenerations are operated parallel to the previously introduced repeaters of a 60 MHz CF system. The 60 MHz system on the coaxial pair 2.6/9.5 mm has a nominal repeater spacing of 1.55 km. The 60 MHz repeaters and the 565 Mbit/s intermediate regenerators can be accommodated together in the same underground container because they have the same maximum and minimum repeater spacing, temperature range and method of connection and also comparable external dimensions. The power loss of the regenerators constructed is only about 3 W per direction; this is the same as the power loss of the repeaters of the 60 MHz system, thereby allowing the same remote power feeding distance to be obtained. The underground regenerators, line terminal devices, and fault locating equipment required for the experimental system are described. M.G.

MULTIBEAM SINGLE FREQUENCY SYNTHETIC APERTURE RADAR PROCESSOR FOR IMAGING SEPARATE RANGE SWATHS Patent Application
Atul Jain, inventor (to NASA) (JPL). Filed 3 Jul. 1980. 21 p. (Contract NAS7-100)
(NASA-Case-NPO-14525-2; US-Patent-Appl-SN-165910) Avail: NTIS. HC A02/MF A01. CSCL 20E.

A single-frequency multibeam synthetic aperture radar for large swath imaging is disclosed. Each beam illuminates a separate 'footprint' (i.e., range and azimuth interval). The distinct azimuth intervals for the separate beams produce a distinct Doppler frequency spectrum for each beam. After range correlation of raw data, an optical processor develops image data for the different beams by spatially separating the beams to place each beam of different Doppler frequency spectrum in a different location in the frequency plane as well as the imaging plane of the optical processor. Selection of a beam for imaging is made in the frequency plane by adjusting the position of an aperture, or in the image plane by adjusting the position of a slit. The raw data is processed in digital form in an analogous manner. NASA

ADVANCED COMMUNICATIONS SATELLITES

Joseph N. Sivo Washington 1980 19 p refs Presented at the Ann. Meeting of AAS and AIAA, Boston, 20-23 Oct. 1980
(NASA-TM-81599; E-585) Avail: NTIS HC A02/MF A01 CSCL 17B

The increase in demand for satellite communications services brought about shortages in available transponder capacity, especially at C-band. Interest shifted to the Ku-band frequency and currently carriers are rapidly moving to secure orbital slots for future satellite development. Projections of communications service demands over the next decade indiate growth in voice, data, and video services such that saturation of both C-band and Ku-band will occur by 1990. Emphasis must and will shift to Ka-band (20/30 GHz) frequency for fixed-satellite service. Advanced technologies such as multibeam antennas coupled with on-board satellite switching to allow implementation in this band of very high capacity satellite systems will be applied to meet the demand. Satellite system concepts that are likely in the 1990's and are likely to bring a new dimension to satellite delivered communication service are presented. The NASA 30/20 GHz communications satellite system demonstration program is discussed with emphasis on the related technology development. L.F.M.

A QUANTITATIVE ANALYSIS OF INTER-ISLAND TELEPHONY TRAFFIC IN THE PACIFIC BASIN REGION (PBR)
David D. Evans and Clifford H. Arth Washington Sep. 1980 20 p refs
(NASA-TM-81587; E-566) Avail: NTIS HC A02/MF A01 CSCL 17B

As part of NASA's continuing assessment of future communication satellite requirements, a study was conducted to quantitatively scope current and future telecommunication traffic demand in the South Pacific Archipelagos. This demand was then converted to equivalent satellite transponder capacities. Only inter-island telephony traffic for the Pacific Basin Region was included. The results show that if all this traffic were carried by a satellite system, one-third of a satellite transponder would be needed to satisfy the base-year (1976-1977) requirement and about two-thirds of a satellite transponder would be needed to satisfy the forecasted 1985 requirement. THE RECONSTRUCTION OF ANALOG SIGNALS FROM THE SIGN OF THEIR NOISY SAMPLES
Elias Masry 1 Aug. 1980 38 p refs
(Contract N00014-75-C-0652)
(AD-A087650) Avail: NTIS HC A03/MF A01 CSCL 09/3

The reconstruction of continuous-time signals s(t) from the sign of their (deliberately) contaminated samples is considered. Sequential, generally nonlinear estimates of s(t) are established and their performance is studied; error bounds and convergence rates are derived. The signal s(t) need not be bandlimited. The convergence rates obtained here are faster than those obtained for nonsequential estimates. The degradation in the reconstruction of the signal, due to transmission over an arbitrary noisy channel, is also investigated and bounds on the additional error are obtained. GRA

LOW SIDELOBE S-BAND LINE SOURCE ARRAY Interim Report
Gary E. Evans and William F. Hoover, Jr. Griffiss AFB, N.Y. RADC Mar. 1980 138 p
(Contract F19628-78-C-0151; AF Proj. 4600)
(AD-A087651; RADC-TR-79-338) Avail: NTIS HC A07/MF A01 CSCL 17/9

This report deals with the study and fabrication of a low

sidelobe, S-band linear dipole array. The specific design of this line source makes it directly applicable to a full size planar array for use in a high power, high efficiency, low sidelobe, tactical radar. Electrical and mechanical design details are discussed, including development of wideband, high isolation couplers, development of a crossed dipole radiator, the use of air dielectric stripline as a transmission medium, considerations regarding the corporate fed power divider, grating lobe considerations, size and weight budgets, and tactical constraints. Sources of both correlated and uncorrelated errors have been identified. A computer program is discussed which uses this error information to calculate statistically the azimuth patterns for the line source and for an array of N line sources. An error and tolerance budget has been determined that assures the array sidelobes to be below the -35, -38, -41, and -50dB level (first, second, third, and wide angle lobes, respectively. GRA

PROCEEDINGS OF THE WORKSHOP ON MILLIMETER AND SUBMILLIMETER ATMOSPHERIC PROPAGATION APPLICABLE TO RADAR AND MISSILE SYSTEMS
Oskar M. Essenwanger, ed. and Dorothy A. Stewart, ed. Feb. 1980 187 p refs Workshop held 20-22 Mar. 1979, Redstone Arsenal, Ala.
(AD-A087754; AD-E950010; DRSMI-RR-80-3-TR) Avail: NTIS HC A09/MF A01 CSCL 20/14

A workshop on millimeter and submillimeter wave propagation through the atmosphere was held on 20-22 March 1979 at Redstone Arsenal, Alabama. This workshop served as a forum where scientists in diversified fields exchanged information on the latest results and discussed controversial issues and unresolved problems. The first few papers were concerned with MICOM needs. They specified the operating regions of interest for tactical applications and explained the rationale for the selection of these regions. The Terminal Homing Measurements program was described. Several papers discussed absorption by water vapor. Classical theories do not adequately describe the measured absorption in window regions between strong absorption lines. Alternate methods of explaining the discrepancies are to introduce reasonable modifications to existing models of line shapes or to consider the effect of water vapor dimers. Other effects on atmospheric propagation and instrumentation for measuring these effects were also discussed. Absorption and scattering by hydrometeors, dust and smoke were considered. Additional papers were concerned with terrain effects, turbulence, natural atmospheric emissions, refractivity gradients, and the relatively new method of pulse generation by swept-gain superradiance. MULTIPATH PROPAGATION OVER SNOW AT MILLIMETER WAVELENGTHS
Uve H. W. Lammers and Dallas T. Hayes Feb. 1980 45 p refs
(AF Proj. 4600)
(AD-A087747; RADC-TR-80-54) Avail: NTIS HC A03/MF A01 CSCL 20/14

A series of multipath measurements over snow were conducted at Hanscom AFB during the winter 1978/1979. Data were obtained over a path-length of 179.5 m at frequencies of 35, 98, and 140 GHz. The gently rolling grass-covered terrain showed maximum height differences of 0.8 m. Snow covers included freshly fallen snow, old metamorphic snow, and sleet. The equipment consisted of CW transmitters at 2 m height and receivers mounted on a vertical positioner to measure the height-gain pattern of the received signal between 0.2 and 4 m height. Grazing angles for this geometry range between 0.5 and 2 degrees. Measured interference patterns between direct and terrain-reflected rays were generally coherent in appearance and exhibited cancellation depths of 20 dB and lower, depending on the type of snow cover. A computer program was developed in order to model the reflection as a specular process, with the underlying terrain represented by a series of linear sloping segments, derived from actual terrain height measurements. With appropriate transitions between the linear segments and reflection coefficients calculated from relevant snow parameters, calculated and measured height-gain patterns display quite similar qualities. GRA

STATISTICAL CHARACTERIZATION OF ROUGH TERRAIN
John F. Lennon and Robert J. Papa Feb. 1980 43 p refs
(AF Proj. 2305)
(AD-A087746; RADC-TR-80-9) Avail: NTIS HC A03/MF A01 CSCL 20/14

A technique is presented to statistically characterize rough terrain surfaces. The approach is described in terms of a specific example but in principle is quite general and can be adapted to fit any number of situations. The starting point is the use of observed surface height data to generate statistical parameters for probability density functions (PDF) that potentially characterize the data. This involves the use of parameter estimation techniques. The estimated parameters are then used in an hypothesis test to determine the best PDF for the given data. The accuracy of the analysis depends on the available data, the estimators employed, and the determination of appropriate PDF's. The example consists of a large number of terrain regions in an area of eastern Massachusetts. Experimental data in the form of electromagnetic scattering from the surface are available for this site. Because of the number of cases involved, the complexity of the multivariate height distributions, and the type of measurements available, only a single observation of the multivariate data is used in the present analysis. Techniques to improve the parameter estimation are being pursued. The results of the statistical analysis in terms of mean height, variance, correlation, PDF, and a geologic feature characterizing each subregion are presented. These will be used in an electromagnetic scattering formulation to allow comparison with the experimental data. Once agreement is reached, other areas of interest can then be analyzed in a similar fashion. GRA

HC A05/MF A01 CSCL 09/2

The progress made in evaluating the feasibility of applying charge coupled devices (CCD's) as well as microprocessors to reduce the cost and complexity of automatic speech recognition (ASR) systems are discussed. Experiments were conducted to measure the speed versus accuracy tradeoffs of four speed up techniques. The techniques were demonstrated to be worthwhile in an efficient realtime automatic word recognition (AWR) system. Microprocessor architectures were designed to implement the realtime AWR system and then evaluated in terms of cost and complexity using three different microprocessors: the 8 bit Intel 8085A; the 16 bit Motorola MC68000; and a 16 bit configuration of the AMD 2901A. Of the three, the AMD 2901A proved preferable from both a cost and a performance standpoint. Hardware cost projections for an AWR system featuring an AMD 2901A architecture and a bandpass filter CCD analyzer indicate that the hardware components for such a system should range between $1,500 for a 52 word vocabulary, to about $12,700 for a 780 word vocabulary. A computer program was developed which analyzes and compares the performance of certain types of frequency hopping and psuedonoise (sometimes called direct sequence) spreadspectrum communication systems in the presence of hostile jamming. The program computes the probability of bit or word error as a function of the communication signal parameters (spectrum spreading methods, error-correcting coding, data modulation, bandwidth, etc) and the jamming parameters (jamming modulation, power, bandwidth). The output consists mainly of plots of error probability as a function of one or more of these parameters selected by the user. The plots are produced on an interactive computer graphics terminals, providing rapidly produced results and high user-computer interaction. GRA

The final results from a radio frequency (rf) propagation experiment are presented. The experiment was designed to measure the effects of high-density, explosively produced dust clouds on a series of coherent signals ranging in frequency from 400 MHz to 10 GHz. Both amplitude and phase data were obtained. The observed rf results were found to be consistent with the behavior expected from theoretical considerations and dust densities obtained from a simple model based on material missing from the water and measured cloud volume. Because of the relatively small volume of space affected, rf effects were generally mild, unless a threshold combination of the dust density and the particle size distribution parameter were exceeded. Once the threshold was crossed, extinction coefficients rose to as much as several tens of decibels per kilometer. This was accompanied by the complete loss of a coherent signal component, strong fading, and the apparent onset of multiple scattering. T.M.

A comprehensive account of analytical results for computing electromagnetic fields that are induced by ocean sea water as a result of its motion relative to the geomagnetic field is provided. Emphasis is on the characterization of magnetic field and magnetic field gradient environment. The theoretical results are formulated so as to be directly applicable to the computation of sea water generated magnetic noise and to the assessment of its deletrious effects on the sensitivity of magnetic sensors employed for magnetic anomaly detection over an open ocean. Magnetic field component and gradient spectra are computed both for stationary and moving observation platforms. Author

Robust speech processing in practical operating environments requires effective environmental and processor noise suppression. This report describes the technical findings and accomplishments during this reporting period for the research program funded to develop real time, compressed speech analysis synthesis algorithms whose performance in invariant under signal contamination. Fulfillment of this requirement is necessary to insure reliable secure compressed speech transmission within realistic military command and control environments. Overall contributions resulting from this research program include the understanding of how environmental noise degrades narrow band, coded speech, development of appropriate real time noise suppression algorithms, and development of speech parameter identification methods that consider signal contamination as a fundamental element in the

estimation process. This report describes the current research and results in the areas of noise suppression using the dual input adaptive noise cancellation using the short time Fourier transform algorithms, articulation rate change techniques, and a description of an experiment which demonstrated that the spectral subtraction noise suppression algorithm can improve the intelligibility of 2400 bps, LPC 10 coded, helicopter speech by 10.6 point. In the past, most radar target recognition techniques have concentrated on the use of one dimensionsal target signatures. However, the development of the Synthetic Aperture Radar (SAR) and the recent development of the Inverse Synthetic Aperture (ISAR) technologies have made it possible to obtain radar images of targets and thus allow the use of two dimensional pattern classification schemes for automatic radar target recognition. One such two dimensional shape recognition scheme is a technique known as the method of moments, which has been successfully applied to the recognition of objects imaged in the visible and infrared spectrum. The images used in this investigation were generated by the application of the ISAR technique to turntable radar data and also data obtained from flying aircraft targets. GRA

AN ITERATIVE APPROACH TO THE DECONVOLUTION OF THE NARROWBAND OUTPUTS OF A CONVENTIONAL BEAMFORMER
D. A. Gray. Feb. 1980. 31 p. refs.
(AD-A088276; WSRL-0141-TR) Avail: NTIS. HC A03/MF A01. CSCL 20/14

In conventional beamforming the estimated noise power wave number spectrum is the convolution of the incident distribution with the array response. By removing the effect of the array response an improved estimate of the incident wave-number spectrum may be obtained. In particular the method of progressive substitutions has been widely used to deconvolve array window. By assuming all the incident signals to be a linear super-position of a finite number of plane waves this method is extended to deconvolve the narrowband beam outputs of a conventional beamformer. Two methods are used, the first to deconvolve the complex beam amplitudes and the second to deconvolve the beam powers. The convergence of these proposed interactive solutions is proved and the relationship of the limits to some recently proposed quadratic estimators is shown. GRA

COMPUTATIONS OF THE RADIATION PATTERN OF A REFLECTOR ANTENNA Interim Report
J. K. Hsiao. 26 Aug. 1980. 19 p. refs.
(WF34372000)
(AD-A088273; NRL-MR-4325) Avail: NTIS. HC A02/MF A01. CSCL 20/14

This report describes a mathematical approach to compute the radiation pattern of a reflector antenna. The radiation integral is expanded into an orthogonal series in terms of a field point coordinate. Since this series is orthogonal, coefficients of this series can be easily determined. Once these coefficients are known, radiation patterns at any field point can be readily computed. Since this approach avoids performing the integration of the radiation integral at each field point, it greatly reduces the required computation. A brief description of the computer program is also included in this report. GRA

VOICE COMMUNICATION RESEARCH EVALUATION SYSTEM
Richard L. McKinley. May 1980. 17 p. refs.
(AF Proj. 7231)
(AD-A088100; AFAMRL-TR-80-25) Avail: NTIS. HC A02/MF A01. CSCL 17/2

Aircraft voice communications may be degraded by a variety of sources such as electrical and/or acoustical noise, radio interference, jamming and various other forms of distraction. The Voice Communication Research and Evaluation System, located in the Biodynamics and Bioengineering Division of the Aerospace Medical Research Laboratory, has been developed for the comprehensive analysis and enhancement of operational voice communication. The basic system is comprised of a multi-station voice communication network consisting of the USAF standard aircraft intercommunication system, a standard A-19 diluter-demand oxygen regulation system and an on line computer data collection and data analysis system that displays results in real time. The system is housed in a large reverberation chamber containing a programmable sound source capable of reproducing the spectrum and level of any AF operational noise environment. Standardized voice communication effectiveness test materials are used to assess the performance of any aspect of the total voice communication link, however, emphasis is usually placed upon the performance of the aircrew members. This paper will descibe the salient features of this unique system and provide examples of its application to voice communication problems. GRA

A STUDY OF POWER AND ENERGY IN THE AURORA MODIFICATION PROJECT Final Report
John D. Shipman, Jr. 23 Jul. 1980 28 p
(AD-A088051; NRL-MR-4281) Avail: NTIS
HC A03/MF A01 CSCL 20/3

This report summarizes the results of a series of computer runs at NRL which were designed to determine if the measured loss of power and energy in the Aurora Modification Project tests in the Fall of 1978 was due to increasing capacitance in the water switches during the transit times of the streamers or was due to resistive losses in the water switches. From the results of these analyses, it is concluded that the losses were mainly due to resistance in the intermediate store and pulse forming liner output switches and that the changing switch capacitance mainly rounded the pulse shapes near the peak values without contributing to a major loss of energy. It is suggested that oil switches be considered as a replacement for the water switches since they have less loss, although there are risks and problems involved in their use. GRA

EXPERIMENTAL MEASUREMENTS OF AMBIENT ELECTROMAGNETIC NOISE FROM 1.0 TO 4.0 kHz Final Report
Robert J. Dirger, William D. Meyers, and John R. Davis 31 Jul. 1980 64 p refs
(RR0210141)
(AD-A088090; NRL-8413) Avail: NTIS HC A04/MF A01 CSCL 04/1

The spectral noise density, amplitude probability distribution (APD), and spectral content of ambient noise from 1.0 to 4.0 kHz were measured. Analysis of the recorded data included detailed investigation of the diurnal variation of the noise, comparison of the APDs with two atmospheric noise models, time domain excision of noise impulses to assess the reduction in noise achievable by nonlinear processing, investigation of broadband ionospheric emissions identified as polar chorus, and determination of the statistical variation (in frequency) of the spectral minimum near 3 kHz. The analysis of the diurnal variation suggested the existence of a large propagation anisotropy in the nighttime Earth ionosphere waveguide at 3 kHz, with east to west attenuation significantly lower than north-south attentuation. The observed seasonal and geographical averaged diurnal variations can be interpreted qualitatively in terms of worldwide thunderstorm distributions and day-night changes in the reflecting height of the ionospheric D-layer. The measured spectral noise density values are significantly lower than values measured under similar conditions by earlier investigations; the lower values are attributed to the use of a receiver with a lower intrinsic noise and careful site selection to avoid man made interference. The recorded APDs varied from a Rayleigh form during low noise periods in Norway to a distribtution with a tail at low exceedence values during higher noise periods in both Norway and Italy. Comparison of the APDs with the Field-Lewenstein model and the Middleton model generally showed satisfactory agreement. GRA

HC A03/MF A01 CSCL 20/14

PROPHET denotes a class of radio propagation forecast terminals which represent the culmination of an 11 year development effort at the Naval Ocean Systems Center (NOSC) under the SOLRAD satellite program. The system is unique in that it provides a real-time link between Navy operations personnel and a worldwide network of ground-based and satellite-borne solar-terrestrial environment monitors. This link is used to generate - via distributed data processing - electromagnetic system performance predictions in formats specially tailored to meet the operational requirements of the user. An initial implementation of PROPHET has provided - over a 3 year period - highly successful hf frequency/antenna management support to the Technical Control Facility of the Naval Communication Station at Stockton, CA. This executive summary provides a concise overview of the evolution, structure, function, and accomplishments of PROPHET, together with recommendations for ways in which the PROPHET technology can be applied to recognized operational requirements fo the Navy. Technical details are elaborated in volume 2. GRA

INFORMATION ANALYSIS OF DYNAMICAL RADAR PARAMETERS
H. Vincent Poor 1 Apr. 1980 23 p refs
(Contract DAAK40-79-D-0018)
(AD-A088195; Rept-80-036; DRSMI-RE-CR-80-12) Avail: NTIS HC A02/MF A01 CSCL 17/9

This report examines the extension of the classical information analysis of radar systems to more general situations arising in modern radar practice. In particular, the introduction of dynamics into parameter modeling is considered in an information theoretical context. Such a treatment is motivated by the need to consider parameter dynamics in discrimination-mode radar signal processor design. Expected applications of the proposed techniques include development of theoretical performance limitations which can be used as benchmarks to which the performance of practical systems can be compared. HC A04/MF A01 CSCL 17/9

Visibility is one of the key factors in determining the outcome of battles. With the advent of long range, moving target, air to ground surveillance radars, the motion of both the observing platform and the target have added to the visibility problem, which heretofore was analyzed in terms of shielding. The interaction of such factors as the minimum detectable velocity

of the target, the trajectories of the target and the airborne radar platform, and the terrain and foliage masking combine to control the amount of time which a target is observed in a given scenario. This report continues the work done on dynamic masking, compares the masking calculation with and without foliage on a typical super highway in New England, and finally examines the correlation between predicted and observed foliage and terrain masking. The work was done in connection with the test and evaluation of the Multiple Antenna Surveillance Radar (MASR), a scaled model of a long range moving target surveillance system. MASR operated at L-band with a beamwidth of approximately 4.5 deg. In typical flight operation it observed the target complex from a range of 25 to 40 km. The altitude was selected to give lookdown angles ranging from 3 deg to 6 deg. GRA

HC A03/MF A01 CSCL 17/9

In May 1978, when the U.S. Air Force requested the National Research Council to assess certain aspects of its newest missile defense warning system then under construction at the Otis Air Force Base on Cape Cod, Massachusetts, the facility was the subject of intense public concern that exposure to its radiation emissions might be harmful to humans. The purpose of the radar facility, known as PAVE PAWS (PAVE being a code word for the Air Force unit in charge of the project PAWS, an acronym for Phased Array Warning System) is to detect and track ballistic missiles launched at sea as far as 3,000 nautical miles from U.S. shores. In order to discern ballistic missiles early in their trajectory, it operates at an angle as low as 3 degrees above the horizon. Its long range capacity is achieved by a fairly high average power level of 145kW. The Research Council's initial response was to establish two separate panels to examine the facility--one, the Engineering Panel on the PAVE PAWS Radar System, under the Assembly of Engineering, and the other the Panel on the Extent of Radiation from the PAVE PAWS Radar System Assembly of Life Sciences. This is the report of the Engineering Panel. The report of the second panel, consisting of an analysis of the exposure levels and potential biological effects of PAVE PAWS, will be published separately. GRA

ANALYSIS OF A FINITE LENGTH TUBULAR MONOPOLE ANTENNA DRIVEN BY A COAXIAL LINE
Marvin E. Morris May 1980 44 p refs
(Contract DE-AC04-76DP-00789)
(SAND-79-1557) Avail: NTIS HC A03/MF A01

The problem of a coaxially-driven, finite length tubular monopole antenna over an infinite ground plane is formulated as a rigorous boundary value problem. The resulting coupled pair of singular integral equations is numerically solved for the electric field in the end of the coaxial line and for total current on the antenna. The electric field is used to compute the admittance of the antenna. The admittance, electric field, and current are presented for a wide range of experimentally useful parameters. DOE

ADMITTANCE OF AN INFINITELY LONG MONOPOLE ANTENNA IMMERSED IN A DISSIPATIVE MEDIUM AND DRIVEN BY AN AIRFILLED COAXIAL LINE
Marvin E. Morris May 1980 23 p refs
(Contract DE-AC04-76DP-00789)
(SAND-79-1401) Avail: NTIS HC A02/MF A01

The effect of the dielectric interface between the medium being probed and the end of the coaxial line used to drive the antenna on admittance is discussed. The infinite monopole antenna driven with a coaxial line is used as a model to determine this effect. The integral equation appropriate to this geometry is numerically solved for a wide range of parameters and it is determined that the interface affects the admittance only slightly compared to the more significant effect of changing the drive geometry. The capacitive admittance correction due to the dielectric interface can be ignored for most experimental purposes for antennas immersed in nondissipative media. In dissipative media the situation is more complex. DOE

APPARATUS FOR MEASURING SEMICONDUCTOR DEVICE RESISTANCE Patent
Walter J. Matzen, inventor (to NASA) (Texas Instruments, Inc., Dallas) Issued 19 Aug. 1980 8 p Filed 23 Jun. 1978 Supersedes N78-28340 (16 - 19, p 2520) Sponsored by NASA
(NASA-Case-NPO-14424-1; NASA-Case-NPO-14430-1; US-Patent-4,218,650; US-Patent-Appl-SN-918534; US-Patent-Class-324-62; US-Patent-Class-324-64) Avail: US Patent and Trademark Office CSCL 09A

A test structure is described for enabling the accurate

measurement of the resistance characteristics of a semiconductor material and includes one or more pairs of electrical terminals disposed on the surface of the material to enable measurements of the resistance encountered by currents passed between the terminals. A pair of terminals includes a first terminal extending in a closed path, such as a circle, around a second terminal, so that all currents flowing between the terminals flow along a region of known width and length. Two or more pairs of concentric terminals can be utilized, wherein the ratio of radii of each pair of terminals is the same as the ratio for all other pairs of terminals, to facilitate the calculation of the contact resistance between each terminal and the semiconductor surface, as well as the calculation of the resistance of the semiconductor material apart from the effect of the terminal to semiconductor contact resistances.

(NASA-Case-MFS-25211-1; US-Patent-Appl-SN-168995) Avail: NTIS HC A02/MF A01 CSCL 09A

A self aligning electrical connector device including a receptacle component having a conically contoured interior and a plug component having a correspondingly contoured conical body receivable in the receptacle component is disclosed. The plug component includes a plurality of spaced conductive ring elements having a mating face and the receptacle component includes a plurality of corresponding spaced conductive ring elements providing mating interface with the mating face of the ring elements of the plug component when connected therewith. Each ring element of the receptacle component includes a plurality of segmented portions which defect downwardly when the plug component is inserted therein to assert a biasing force against the face of the ring elements of the plug component providing positive electrical contact and connection between the ring elements of the components. CONTROL ELECTRONICS FOR A MULTI-LASER/MULTI-DETECTOR SCANNING SYSTEM
William Kennedy Aug. 1980 113 p refs
(Grant NsG-7369; Contract JPL-954880)
(NASA-CR-163565; RPI-TR-MP-73) Avail: NTIS HC A06/MF A01 CSCL 09C

The Mars Rover Laser Scanning system uses a precision laser pointing mechanism, a photodetector array, and the concept of triangulation to perform three dimensional scene analysis. The system is used for real time terrain sensing and vision. The Multi-Laser/Multi-Detector laser scanning system is controlled by a digital device called the ML/MD controller. A next generation laser scanning system, based on the Level 2 controller, is microprocessor based. The new controller capabilities far exceed those of the ML/MD device. The first draft circuit details and general software structure are presented. S.F.

ACCELERATED LIFE TESTING EFFECTS ON CMOS MICROCIRCUIT CHARACTERISTICS Final Report, May 1976 - Dec. 1979
1980 89 p
(Contract NAS8-31905)
(NASA-CR-161575) Avail: NTIS HC A05/MF A01 CSCL 09C

This report covers the time period from May 1976 to December 1979 and encompasses the three phases of accelerated testing: Phase 1, the 250 C testing; Phase 2, the 200 C testing; and Phase 3, the 125 C testing. The duration of the test in Phase 1 and Phase 2 was sufficient to take the devices into the wear out region. The wear out distributions were used to estimate the activation energy between the 250 C and the 200 C test temperatures. The duration of the 125 C test, 20,000 hours, was not sufficient to bring the test devices into the wear out region; consequently the third data point at 125 C for determining the consistency of activation energy could not be obtained. It was estimated that, for the most complex of the three device types, the activation energy between 200 C and 125 C should be at least as high as that between 250 C and 200 C. The practicality of the use of high temperature for the accelerated life tests from the point of view of durability of equipment was assessed. Guidelines for the development of accelerated life test conditions were proposed. The use of the silicon nitride overcoat to improve the high temperature accelerated life test characteristics of CMOS microcircuits was explored in Phase 4 of this study and is attached as an appendix to this report. DESIGN, FABRICATE AND TEST AN ELECTRON BOMBARDED SEMICONDUCTOR (EBS) AMPLIFIER Final Report
S. F. Blazo and J. B. Rettig [1980] 42 p
(Contract NAS5-20881)
(NASA-CR-160002) Avail: NTIS HC A03/MF A01 CSCL 09A

The deflected beam EBS amplifier consisting of an electron gun which forms a high energy, low current electron beam, a meander line deflection structure which deflects the electron beam in accordance with the RF input; and a target consisting of an array of EBS diodes, along with the impedance matching circuitry was developed. An efficient and linear 50 W CW EBS amplifier operating at 1.6 GHz suitable for space communication applications is discussed. At this level, the target efficiency was about 45 percent, showing that high efficiency operation could be obtained. Linear operation, so important for multisignal operation and efficient utilization of the limited frequency spectrum, was demonstrated with a gain variation of + or - 1 dB over a 30 dB dynamic range. Microstrip matching techniques were developed and are used in high frequency applications. R.K.G.

(AD-A087478; RADC-TR-80-174) Avail: NTIS
HC A05/MF A01 CSCL 20/14

A variational technique has been used in predicting impedance and dispersion characteristics for the cold test measurements of helical traveling wave tubes. The variational formula of Bevensee is used in this method. An optimal combination of slow wave trial fields is found using Rumsey's reaction integral as a measure of equivalence to the true fields. In contrast to other approximate analyses, the variational formulation has the advantage of including the exact geometry and dielectric of the helical support. In order to verify the technique, two trial field regions have been used in successfully analyzing the sheath helix and the case of a homogeneous dielectric support. A composite metal-ceramic helix has also been analyzed. Simulation for the composite helix shows a reasonable dispersion for some combinations of harmonics over a wide frequency range when results are compared to experiment. However, the impedance computation is not yet satisfactory. In future developments, major modifications will be made to the trial fields in order to satisfy all boundary conditions simultaneously and improve the predicted impedance. In addition, the technique will be applied to other devices including wedge and rod supports. GRA

HC A04/MF A01 CSCL 09/3

Five commercial LSI static random access memory technologies having a 1 kilobit capacity were radiation characterized. Arrays from the transistor-transistor-logic (TTL), Schottky TTL, n-channel metal oxide semiconductor, complementary metal oxide semiconductor (CMOS), and CMOS/silicon on sapphire families were evaluated. Radiation failure thresholds for gamma doserate logic upset, total gamma dose survivability, and neutron fluence survivability were determined. A brief analysis of the radiation failure mechanism for each of the logic families tested is included. Author

INTEGRATED CIRCUIT DESIGN OF A VIDEO RECONSTRUCTOR FOR A RANGE-GATED MOVING TARGET INDICATOR M.S. Thesis
George Achilleus Papadopoulos Dec. 1979 101 p refs
(AD-A084376) Avail: NTIS HC A06/MF A01 CSCL 09/5

The video reconstructors circuit of the channelized or range gated moving target indicator (MTI) is designed for integration or a single dual-in-line integrated circuit package. The developed chip model is tested and its performance evaluated for a wide range of operating conditions. The tests indicate that the model offers superior performance using discrete components. An extension of the technique offers opportunities in reducing the majority of the remaining channel elements to chip size. For many MTI applications this will yield still additional benefits. Full transistor-transistor-logic compatibility of the design makes the devices easily controllable with digital logic. The threshold voltage setting, the output gate control, and the integration time constant can be set by software or firmware. Author

HC A02/MF A01 CSCL 09/1

The marginally stable regime has been distinguished from the unstable regime both qualitatively and quantitatively. New asymptotic techniques for solving the Fresnel-Kirchoff equation for marginally stable resonators were obtained. The method is analytical in nature and yields excellent predictions for the modes and losses of such cavities. Numerical results for both marginally stable and marginally unstable cavities are presented. In addition, conditions for the suitability of using empty resonator modes to describe gain filled cavities have been derived. This deviation is based on manipulations of the differential equation describing gain filled cavities in Hankel transform space. The result is an ordinary, linear Fresnel-Kirchoff integral equation with gain renormalized Fresnel number and eigenvalue. GRA

This progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Both in-house and contract efforts are included. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period included (1) development of theoretical expressions for computing resistivity and hole mobility for boron-doped silicon; (2) completion of a study of problems associated with use of a scanning electron microscope for total dose testing of semiconductor devices; (3) completion of a pilot study to evaluate procedures for measuring 1 to 10 micrometer wide clear and opaque lines viewed with transmitted illumination; (4) completion of a preliminary study of test structures for estimating densities of process-induced random faults in device wafers; and (5) completion of an interlaboratory evaluation of the destructive wire-bond pull test. Also reported is other ongoing work on materials characterization by electrical and physical analysis methods, materials and procedures for wafer processing, photolithography, test patterns, and device inspection and test procedures. A MONOLITHIC GaAs IF AMPLIFIER FOR INTEGRATED RECEIVER APPLICATIONS
D. R. Decker, A. K. Gupta, W. Petersen, and D. R. Chen 1980 18 p refs
(Contract N00014-78-C-0624)
(AD-A088298) Avail: NTIS HC A02/MF A01 CSCL 17/2

A monolithic GaAs integrated amplifier was constructed for the 500 to 1000 MHz intermediate frequency band. The amplifier provides 8.0 + or - 1.5 dB gain across the band. The output of the amplifier utilizes a source follower configuration to obtain a favorably low output VSWR of less than 1.5:1 (return loss = 15 dB). All bias lines with integral bypass capacitors are contained on the chip and this amplifier is suitable for further integration as a building block of a monolithically integrated receiver front end. BUILDING BLOCK FOR AN ORTHONORMAL-LATTICE-FILTER ADAPTIVE NETWORK Interim Report
W. F. Gabriel 10 Jul. 1980 42 p refs
(RR0210101; RR0210541)
(AD-A088088; NRL-8409) Avail: NTIS HC A03/MF A01 CSCL 09/5

The recent algorithm for a multistage multichannel orthonormal lattice filter proposed by M. Aftab Alam is a welcome addition to the library of adaptive-processing algorithms and provides a flexible alternative to the conventional approach of an optimum Weiner filter. This algorithm is based on a Gram-Schmidt orthonormalization procedure which is similar to cascade adaptive processing techniques described in earlier works. One of the most desirable features of this type of processing network is that it can be implemented with simple one-stage orthogonal-filter building blocks which directly filter the input data samples. These building blocks are the major subject of this report, and a particular configuration is developed based on a modified version of the familiar Howells-Applebaum algorithm. It can be implemented in either analog or digital form, data storage is not required, it is unconditionally stable, speed of convergence is no longer a problem, and the design is simple. The performance characteristics of a complete orthogonal-lattice-filter network operating in the spacial domain were simulated for example cases of one, two, and three strong incoherent signal sources spaced within a beamwidth for a eight-element linear-array antenna. The adaptive spacial filter patterns and the transient responses demonstrate that the building block has sufficient transient-response speed and control to permit full use of the processing capabilities inherent in a Gram-Schmidt cascade network. APPLICATION OF IMAGE INTENSIFIER TECHNOLOGY TO THE MILITARY, SCIENTIFIC, INDUSTRIAL, EDUCATIONAL, AND MEDICAL COMMUNITIES M.S. Thesis Final Report
Patrick H. Orell 30 May 1980 99 p refs
(AD-A088165) Avail: NTIS HC A05/MF A01 CSCL 09/1

This research paper addresses the applications of image intensifier technology to the military, scientific, industrial, educational and medical communities. Image intensifiers are components, that when incorporated into scopes, photographic cameras, television cameras and weapons delivery systems, allow the operator visibility into dark or low illumination areas. The technology has surfaced within the last twenty years and has been, until recently, confined to the military for applications. Image intensified devices are rapidily becoming more popular for various applications, yet many persons are not aware of their existence or potential. The paper is written in non-technical terms to describe the physical make-up of first and second generation Image Intensifiers and addresses the newly developed charged coupled devices and third generation intensifiers under development. It covers a representative sample of applications that have been documented to date by the various manufacturers of Image Intensifiers and the laboratories and agencies that evaluate them. The paper incorporates 37 photographs and illustrations of devices and their applications in support of the communities listed. A list of documented applications and an Image Intensifier tube sensitivity chart is provided for information and reference. GRA

EVALUATION OF ADVANCED TECHNOLOGIES FOR POWER TRANSFORMERS, PART 1 Final Report, Nov. 1976 - Mar. 1979
S. F. Philip, J. R. Morris, D. K. Bartosh, J. R. Mcloughlin, C. W. Reed, W. F. Westendorp, H. M. Schneider, and E. C. Schrom Jun. 1980 185 p refs 2 Vol.
(Contracts DE-AC01-77ET-29069; EC-77-C-01-2134)
(DOE/RA-2134/01) Avail: NTIS HC A09/MF A01

The feasibility of using the following principal design concept for power transformers was explored: sheet conductors for the windings; a system of sealed, self-contained, annular cooling ducts containing circulating cooling fluid to cool the windings; polymer film for turn-to-turn insulation; and compressed gas insulation. Experimental and analytical studies indicate that the sheet wound, compressed-gas-insulated design should result in power transformers of significantly smaller size and weight when compared with oil-filled units of equivalent rating. These advanced technologies offer the opportunity for the design of more efficient power transformers. DOE

AC LOSSES IN TYPE-2 SUPERCONDUCTORS
John R. Clem 1979 66 p refs
(Contract W-7405-eng-82)
(IS-M-280) Avail: NTIS HC A04/MF A01

The physics of ac losses in type 2 superconductors and in multifilamentary superconduction normal composite conductors is described. As an introduction, the ac eddy current losses in a homogeneous normal conducting cylindrical specimen subjected to an alternating applied magnetic field are briefly reviewed. The ac losses in a superconducting cylindrical specimen next are discussed in detail, with emphasis on the losses in a specimen subjected to an alternating applied longitudinal magnetic field. In general dissipation occurs via both flux flow losses, which are analogous to eddy current losses in the normal state, and hysteretic losses, which arise from bulk and surface pinning as well as annihilation of vortices of the opposite sense. Tests are suggested by which the dominant loss mechanisms can be identified. Finally, the losses in multifilamentary superconducting normal composite conductors are reviewed. DOE

EVALUATION OF ALTERNATIVE INSULATING OILS FOR USE IN TRANSFORMERS AND OTHER ELECTRICAL APPARATUS: CHARACTERISTICS OF INSULATING OILS FOR ELECTRICAL APPLICATION Summary Report

T. O. Rouse Feb. 1980 100 p refs
(EPRI Proj. 562-1)
(EPRI-EL-809-SY) Avail: NTIS HC A05/MF A01

There is a realistic possibility that demand for traditional naphthenic transformer oils will exceed the available supply in the mid 1980's. The results of a program directed toward evaluating alternate fluids are summarized. Oils derived from paraffinic crude sources are predicted to be more plentiful. The results of studies suggest that these paraffinic coils will be satisfactory supplements replacement fluids. Because of the differences in low temperature behavior of the two types of oils, careful consideration must be given to matching a given oil to a given application. DOE

(EPRI-EL-1300) Avail: NTIS HC A14/MF A01

Paraffinic crude oils are known to contain significant amounts of wax that, if not removed, could provide an insulating oil having a high pour point which could interfere with the low temperature functioning of most electrical equipment. Because of the wax problem, it was necessary to study the behavior of the paraffinic base insulating oil in representative production size equipment, such as tap changers and power circuit breakers, to be sure that the equipment would operate if exposed to temperatures as low as 40 C. Other studies, such as material compatibility, lubricity of the new oil, arc formed gas, response to dielectric breakdown levels represented in large power transformers, and accelerated aging in distribution transformers, were important to ensure full acceptance of a replacement oil. The work in this project was separated into different phases in order to provide a broad study of the new type of insulating oil. This evaluation of experimental oils indicated that paraffinic transformer oils as a class can provide useful supplements or replacements for naphthenic oils. DOE

MECHANICAL PROPERTIES OF HIGH-CURRENT MULTIFILAMENTARY Nb3Sn CONDUCTORS
R. M. Scanlan, R. W. Hoard, D. N. Cornish, and J. P. Zbasnik 23 May 1980 13 p refs Presented at the Intern. Cryogenic Mater. Conf., Upton, N.Y., 28-29 May 1980
(Contract W-7405-eng-48)
(UCRL-84040; CONF-800587-1) Avail: NTIS HC A02/MF A01

Nb3Sn is a strain sensitive superconductor which exhibits large changes in properties for strains of less than 1 percent. The critical current density at 12 T undergoes a reversible degradation of a factor of two for compressive strains of about 1 percent and undergoes an irreversible degradation for tensile strains on the Nb3Sn greater than 0.2 percent. One conductor consists of filaments of Nb3Sn in a bronze matrix, and much progress has been made in understanding the mechanical behavior of this composite. The Nb3Sn filaments are placed in compression due to the differential thermal contraction between Nb3Sn and bronze which occurs when the composite is cooled from the Nb3Sn formation temperature (typically 700 C) to the 4.2 K operating temperature. The general behavior of the critical current when this conductor is subjected to a tensile stress is an increase to a maximum when the compressive strain on the Nb3Sn is relieved, followed by a decrease as the Nb3Sn filaments are placed in tension. POWER RATINGS OF rf THIN FILM RESISTIVE ATTENUATORS
F. R. Smith Jun. 1980 15 p ref
(Contract DE-AC04-76DP-00613)
(BDX-613-2404) Avail: NTIS HC A02/MF A01

Most radio frequency (rf) assemblies built using hybrid microcircuit technology employ thin film attenuators. These attenuators are subject to moderate rf peak power and to moderate average power. Because of intracircuit mismatch, extra considerations of power requirements must be given. To meet these requirements, selected thin film resistive attenuators operated under large rf power conditions were investigated, and the power margin in which these attenuators can be used was defined. ELECTRO-OPTICAL MEASUREMENTS OF SOLID INSULATOR SURFACE FIELDS AND SURFACE CHARGING IN VACUUM
D. M. Hyslop, J. E. Thompson, and T. S. Sudarshan 21 Apr. 1980 113 p refs
(Grant NBS7-89009)
(PB80-192875) Avail: NTIS HC A06/MF A01 CSCL 09A

Electro optical measurements of the electric field along insulator surfaces and in the bulk of insulator materials was made to determine the mechanisms associated with insulator surface flashover. The Pockels effect in KDP was used in conjunction with a polarization interferometer and a pulsed laser to measure interfacial and bulk fields for KDP/vacuum interfaces. The results show that the solid insulator surface and bulk electric field distributions are spatially nonuniform. The electric field at the cathode is considerably enhanced while the field at the anode is reduced. The time evolution and steady state behavior of the insulator electric field distributions for DC, 60 Hz AC, and pulsed excitations are presented. GRA

NUMERICAL SOLUTION OF A NONSTEADY BLAST WAVE PROPAGATION IN TWO-PHASE (SEPARATED FLOW) REACTIVE MEDIUM
Shmuel Eidelman and Alexander Burcat Jan. 1980 32 p refs
(TAE-388) Avail: NTIS HC A03/MF A01

The problem of a detonation in a two phase reactive medium is fully solved using the flux corrected transport algorithm (FCT) for an artificial viscosity method. This method is used to solve nonlinear hyperbolic equations of two phase flow and was chosen for its ability to suppress numerical oscillations and to describe complex shock waves. The solution of the problem is described. The details of a test case based on the analytical solution of a strong adiabatic point explosion are given. E.D.K.

THE MECHANISM OF A DETONATION WAVE ENHANCEMENT IN A TWO-PHASE COMBUSTIBLE MEDIUM
Shmuel Eidelman and Alexander Burcat Jan. 1980 25 p refs Presented at the 18th Intern. Combust. Symp.

(TAE-393) Avail: NTIS HC A02/MF A01

The mechanism of the enhancement of a detonation wave in a two phase reactive media was numerically explored. A special algorithm was used in order to differentiate between the numerical and the phenomenological oscillations. The oscillation of the main detonation wave was caused by a set of secondary waves, produced in the reaction zone behind the wave front. The wave length of the secondary waves was found by numerical methods. The graphical presentation of the process provides an overall picture of the mechanism of wave enhancement. E.D.K.

DEPRIMING OF ARTERIAL HEAT PIPES: AN INVESTIGATION OF CTS THERMAL EXCURSIONS Final Report, Sept. 1978 - Aug. 1980

D. Antoniuk and D. K. Edwards 20 Aug. 1980 214 p refs (Contract NAS3-21740)

(NASA-CR-165153; TRW-34129-6001-UT-00) Avail: NTIS HC A10/MF A01 CSCL 20D

Four thermal excursions of the Transmitter Experiment Package (TEP) were the result of the depriming of the arteries in all three heat pipes in the Variable Conductance Heat Pipe System which cooled the TEP. The determined cause of the depriming of the heat pipes was the formation of bubbles of the nitrogen/helium control gas mixture in the arteries during the thaw portion of a freeze/thaw cycle of the inactive region of the condenser section of the heat pipe. Conditions such as suction freezeout or heat pipe turn-on, which moved these bubbles into the active region of the heat pipe, contributed to the depriming mechanism. Methods for precluding, or reducing the probability of, this type of failure mechanism in future applications of arterial heat pipes are included. Author

WIND TUNNEL INVESTIGATION OF THE TITAN FORWARD SKIRT COMPARTMENT VENT FROM A FREE-STREAM MACH NUMBER OF 0.80 TO 1.96

Albert L. Johns Washington Sep. 1980 42 p refs

(NASA-TM-81572; E-541) Avail: NTIS HC A03/MF A01 CSCL 20D

A test was conducted to determine the flow characteristics of the Titan forward skirt compartment vent over a free stream Mach number range of 0.80 to 1.96. The vent was mounted in a flat plate and the plate was flush mounted to the tunnel side wall with coinciding center lines. Air was discharged from a duct, located on the tunnel side wall behind the plate, through a canted aft 30 deg honeycomb vent into the free stream. Data for the analysis of the Titan forward skirt compartment venting during ascent through the atmosphere are provided. Full scale simulated flight hardware, such as the honeycomb vent, duct corrugations and field joint ring were used. Boundary layer thicknesses were used to vary boundary height. The highest vent discharge coefficient for any given Mach number and vent pressure ratio generally occurred at the maximum displacement thickness. With no vent flow the static pressure in the vent region was generally less than the free stream static pressure. With vent flow, the static pressures upstream of the vent increased, and those downstream of the vent decreased. R.K.G.

AEROTHERMAL ANALYSIS OF A WING-ELEVON COVE WITH VARIABLE LEAKAGE

Roane L. Hunt Washington Sep. 1980 44 p refs

(NASA-TP-1703; L-13751) Avail: NTIS HC A03/MF A01 CSCL 20D

A mathematical model of the heating associated with leakage within the space shuttle orbiter wing elevon cove was used to analyze the aerothermal response of the structure. The analysis was applied to wind tunnel results and to shuttle entry conditions. A parametric study described the mechanism by which the energy of the ingested mass is distributed as a function of the Reynolds number, wall conductivity, surface emissivity, and cove height and length. The rate at which energy was transferred into the cove interior was primarily determined by the combined effects of the convection, wall capacitance, and internal radiation terms. Correlation with wind tunnel results indicated that the cold wall convective heating rates, wall temperature, and gas temperature of the cove were predicted by the analytical model for short exposure times. Predicted transient thermal response of the elevon cove subjected to shuttle entry conditions indicated that the allowable leak area at the cove seal was 20 percent less than that previously indicated by experiment. CHEMICAL REACTIONS IN TURBULENT MIXING Annual Interim Scientific Report, 15 Apr. 1979 - 14 Apr. 1980

H. W. Liepmann, G. L. Brown, P. E. Dimotakis, and A. Roshko 25 Jun. 1980 29 p refs

(Contract F49620-79-C-0159; AF Proj. 2307)

(AD-A088529; GALCIT-151-A; AFOSR-80-0625TR) Avail: NTIS HC A03/MF A01 CSCL 20/4

The combustion facility (H2-F2) is now nearing completion. As of this writing, a high speed mixing layer has been realized in the test section, using high pressure air. This certifies the flow facility down to and including the test section. Preliminary results on the effect of high heat release in a turbulent mixing zone were obtained in the NO-O3 experiment. These results are consistent with predictions based on previously measured p.d.f.'s in non-reacting mixing layers, but in conspicuous disagreements with a variety of accepted model calculations. These results demonstrate again the important influence of the large scale

coherent structures on chemical reactions in turbulent flows. The Laser Induced Fluorescence technique has now been extended to allow direct space and time resolved measurements of the reaction products. The first four channels of the multi-channel laser Doppler velocimetry system are essentially completed. The first experiments using this new development are expected in the course of this summer. Digital image analysis of particle streak photography has also been explored as a direct means of two dimensional measurements of the velocity field in a plane. Finally, a prototype system using a 100 element acoustic detector array has been completed. Initial measurements with four of these channels using 300 kHz sound have been successfully made. GRA

BOUNDARY-LAYER FLOW ON AN AXISYMMETRIC BODY WITH AN INFLECTED STERN. Final Report
Thomas T. Huang, Nancy C. Groves, and Garnell Belt. Aug. 1980. 67 p. refs.
(AD-A088526; DTNSRDC-80/064) Avail: NTIS HC A04/MF A01 CSCL 20/4

Static pressure distributions, mean velocity profiles, distributions of turbulence intensities, and Reynolds stresses, spatial correlation coefficients, and the Taylor microscale of turbulence were measured across the stern boundary layer of an axisymmetric body with an inflected stern. A theoretical and numerical iteration scheme, which uses the boundary layer and open wake displacement body, is found to model satisfactorily the viscid-inviscid interaction between the thick stern boundary layer and the external potential flow. The measured values of turbulence intensity, eddy viscosity, and mixing-length parameters in the stern region are found to be much smaller than those of a thin boundary layer. An approximate similarity characteristic for the thick axisymmetric stern boundary layer is obtained when the measured mixing-length parameters, the measured correlation length scales, and the measured Taylor microscales are normalized by the square root of the boundary-layer cross-sectional area instead of the local boundary layer thickness. When this simple similarity hypothesis for the mixing length and the displacement body is incorporated into the McDonnell Douglas Corp., Cebeci-Smith differential boundary-layer method, modified to consider the displacement body and wake, the theory predicts very well the measured distributions of the mean velocity throughout the entire stern boundary layer. GRA

THEORETICAL AND EXPERIMENTAL INVESTIGATION OF COHERENT STRUCTURE IN THE TURBULENT BOUNDARY LAYER. Annual Report, 1 May 1979 - 30 May 1980
D. E. Abbott, C. R. Smith, and J. D. A. Walker. May 1980. 17 p. refs.
(Contract F49620-78-C-0071; AF Proj. 2307)
(AD-A088248; AFOSR-80-0567TR) Avail: NTIS HC A02/MF A01 CSCL 20/4

This project combines both experimental video flow visualization studies and theoretical investigations of a series of phenomenological and theoretical models based upon the three dimensional details of convected, coherent structural elements of a turbulent flow as it interacts with a solid surface. The progress over the past year has led to the experimental consideration of range of sub-problems including high Reynolds Number (4,000,000) turbulent flows, the effect of surface modification on low-speed streak formation, and the effect of vortex loop interaction with a solid boundary. To augment the visualization pictures, a computerized video-digitizing system has been developed. Preliminary results show tremendous promise for obtaining quantitative data from flow visualization pictures. The specific thrust of the theoretical studies has been focussed on three areas: (1) how two and three dimensional vortex structures interact with wall boundary layers, (2) the development of a new type of prediction method for two dimensional turbulent boundary-layer flows, and (3) improvement in numerical techniques for solving parabolic, boundary-layer equations. FLUOMEG: A PLANAR FINITE DIFFERENCE MESH GENERATOR FOR FLUID FLOW PROBLEMS WITH PARALLEL BOUNDARIES
C. Kleinstreuer (Rensselaer Polytechnic Inst., Troy, N.Y.) and M. R. Patterson. May 1980. 63 p. refs.
(Contract W-7405-eng-26)
(ORNL/TM-7115) Avail: NTIS HC A04/MF A01

A two or three dimensional finite difference mesh generator capable of discretizing subrectangular flow regions (planar coordinates) with arbitrarily shaped bottom contours (vertical dimension) was developed. This economical, interactive computer code, written in FORTRAN IV and employing DISSPLA software together with graphics terminal, generates first a planar rectangular grid of variable element density according to the geometry and local kinematic flow patterns of a given fluid flow problem. Then subrectangular areas are deleted to produce canals, tributaries, bays, and the like. For three dimensional problems, arbitrary bathymetric profiles (river beds, channel cross section, ocean shoreline profiles, etc.) are approximated with grid lines forming steps of variable spacing. Furthermore, the code works as a preprocessor numbering the discrete elements and the nodal points. Prescribed values for the principal variables can be automatically assigned to solid as well as kinematic boundaries. DOE

TWO-PHOTON EXCITATION OF NITRIC OXIDE FLUORESCENCE AS A TEMPERATURE INDICATOR IN UNSTEADY GAS-DYNAMIC PROCESSES
R. L. McKenzie and K. P. Gross (Polyatomics Research, Inc., Mountain View, Calif.). Sep. 1980. 56 p. refs. Submitted for publication
(NASA-TM-81220; A-8284) Avail: NTIS HC A04/MF A01 CSCL 14B

A laser induced fluorescence technique, suitable for measuring fluctuating temperatures in cold turbulent flows containing very low concentrations of nitric oxide is described. Temperatures below 300 K may be resolved with signal to noise ratios greater than 50 to 1 using high peak power, tunable dye lasers. The method relies on the two photon excitation of selected ro-vibronic transitions. The analysis includes the effects of fluorescence quenching and shows the technique to be effective at all densities below ambient. Signal to noise ratio estimates are based on a preliminary measurement of the two photon absorptivity for a selected rotational transition in the NO gamma (0,0) band. S.F.

ADVANCED VERY HIGH RESOLUTION RADIOMETER, MOD 2 ENGINEERING REPORT Final Report
[1980] 104 p.
(Contract NAS5-23400)
(NASA-CR-160034) Avail: NTIS HC A06/MF A01 CSCL 14B

The Advanced High Resolution Radiometer, Mod 2 (AVHRR/2) is a modification of the original AVHRR (AVHRR/1) to expand the number of channels from four to five and provide additional sensing in the infrared region. A comparison of the spectral regions employed in the two instruments is given. Three of the channels are the same on both instruments. The difference in instruments is in the long wave IR region where a single channel was replaced by two channels. The modification from AVHRR/1 to AVHRR/2 was done with a minimum of changes. The areas of change are highlighted and the modifications by module are summarized. It is seen that the primary changes are in the relay optics and in the cooler. In this development program only two models are involved. The first model, the Optical Test Model was constructed and tested to prove the performance and structural integrity of the optical system and the modified cooler. The second model constructed is the Protoflight. Only the areas of the AVHRR/2 which were modified from the AVHRR/1 design are discussed. E.D.K.

(AF Proj. 7184)
(AD-A087805; AFAMRL-TR-80-27) Avail: NTIS
HC A05/MF A01 CSCL 14/5

Three predictors of photographic image quality, Inverse Square Law (ISL), Modulation Transfer Function (MTF), and Sun's Equation, were compared against two subjective techniques: Resolving Power (RP) and Visual Image Evaluation (VIE), and five objective techniques: Acutance, Edge Width, Reciprocal Edge Spread (RES), and two MTF/Aerial Image Modulations (MTF/AIM). Tribar targets at four nominal contrast levels were photographed while the film plane was driven through 7 1/2 cycles of sinusoidal image motion at seven peak-to-peak displacement amplitudes, 0.00000 (i.e., static), 0.00025, 0.00050, 0.00075, 0.00100, 0.00125, and 0.00150 inches. An analysis of variance (ANOVA) was performed for the RP data. Targets, Amplitudes, and their interaction were found to be highly significant ($p < 0.01$). The independent variables and their interactions accounted for over 96 percent of the total experimental variance. The three predictive models (ISL, MTF, and Sun's Equation) all were highly correlated ($r > 0.96$) linear functions of RP. The VIE technique also proved to be highly linear correlate of RP ($r = 0.95915$). GRA

LIQUID SURFACE LEVITATION HOLOGRAPHY. PART 1: THEORETICAL Interim Report
Alfred V. Clarke, Jr. 11 Aug. 1980 109 p. refs
(RR0230345)
(AD-A088418; NRL-8205) Avail: NTIS HC A06/MF A01
CSCL 20/1

The liquid surface levitation holography system has been analyzed, paralleling analyses by previous investigators but treating several new areas. Depth of focus and depth of field of the acoustic lens system are considered, accounting for differences in the acoustic properties of the imaging and object-tank fluids. The mechanical properties of the minitank membrane are shown to have three significant effects: multiple internal reflections of acoustic waves are enhanced in the minitank, which causes the minitank transfer function to become oscillatory for large imaging-fluid depths; deformation of the membrane can degrade the focused acoustic image; and coupling between motions of the membrane and of the liquid surface occurs at low spatial frequencies. Possible coupling between the acoustic field quantities (pressure, density, and velocity) and the surface levitation field is shown to be negligible for a typical system. The low-spatial-frequency deformation (bulge) of the liquid surface is calculated for typical system parameters. The natural frequencies of oscillation of the surface are much less than the rate at which the surface is excited. Consequently the bulge builds up to a steady-state value. GRA

Worldwide research on acoustic holography is covered. Theory, uses, equipment design, and imaging techniques are presented. Most of the studies are general and not applied to a specific use of acoustic holography. However, there are citations which do discuss its use in medicine, nuclear reactors, and nondestructive testing. This updated bibliography contains 328 citations, 34 of which are new entries to the previous edition. GRA

AUTOMATING THE E-BEAM LASER Interim Report
Raymond G. DeBiase 30 Nov. 1979 28 p
(Contract F04701-79-C-0080)
(AD-A079529, SD-TR-79-10, TR-0080(5940-02)-3) Avail: NTIS HC A03/MF A01 CSCL 20/5

Experiments conducted in the E beam Laser Laboratory require the setting of gas flows, pressures, and voltages in a timed sequence, with a variety of sensors monitoring the system. The report describes the use of a CROMEMCO microcomputer and other hardware, and details a BASIC program that senses and displays process variables digitally, reads in process parameters interactively, acquires data during an experiment, and computes and prints out test conditions and results. INVESTIGATION OF DISCHARGE PROCESSES IN ELECTRICALLY EXCITED BLUE/GREEN LASERS Final Report, 1 Jun. 1979 - 31 May 1980
Walter J. Wiegand 31 Jul. 1980 48 p refs
(Contract N00014-79-C-0593)
(AD-A087682, UTRC-R80-924780-1) Avail: NTIS HC A03/MF A01 CSCL 20/5

Total and partial cross sections for mercuric bromide (HgBr2) electron attachment and ionization reactions of importance in laser discharges have been measured in electron beam experiments. Corresponding rate coefficients have been determined independently in a pulsed, electron swarm apparatus. These studies have determined that the electron impact ionization cross section of HgBr2 is very large, increasing from a threshold at 10.6 eV to a value of 2 x 10 to the minus 15th power sq cm at 70 eV, with HgBr2 ion being the principal ion formed at low energies. Beam measurements also have revealed only one electron loss process, dissociative attachment. This attachment reaction which produces Br ion has a threshold energy of 3.1 eV and a peak cross section of 1 x 10 to the minus 17th power sq cm at 3.7 eV. From swarm measurements, an attachment rate coefficient of 1.5 x 10 to the minus 10th power cu cm/sec at a few electron volts average electron energy has been determined. This value is consistent with cross section values determined from beam measurements and with values inferred from kinetic modeling studies of electron beam controlled HgBr2 laser discharges. GRA

ADVANCED CONCEPTS IN CLOSED-CYCLE LASERS Final Technical Report, 6 Dec. 1976 - 30 Sep. 1979
Robert A. Olson and Dennis F. Grosjean Wright-Patterson AFB, Ohio Air Force Aero Propulsion Lab. Mar. 1980 187 p refs
(Contract F33615-76-C-2177; AF Proj. 2301)
(AD-A088226, AFWAL-TR-80-2026) Avail: NTIS HC A09/MF A01 CSCL 20/5

The status of closed-cycle-laser technology is reviewed. The technology and performance of closed-cycle lasers in a recirculating loop and in a novel annular-flow-return configuration are discussed. High-repetition-rate laser operation has been achieved in high-pressure mixtures of Ar:Xe, Ne:Xe, He:Xe, He:Kr, He:Ar, and CO2:CO:Xe:He. New laser lines at 5.13 and 5.44 microns have been observed for the He-Xe laser which generated a maximum average laser output power of 5.1 W at 9.5 kHz. Closed-cycle XeCl laser operation employing a recirculating-loop configuration is discussed. Previously measured laser-seeding-agent photoabsorption cross sections and photoionization yields have been verified. Absolute measurements of UV emission from a CO spark source and measurements of UV emission from a CO2:N2:He capillary discharge have been made. A sliding spark and a dielectric-coupled discharge have been investigated as laser-preionizaton sources. Mercury-halide photolytic excitation studies have been made, and HgBr2 photoabsorption cross sections have been measured. GRA

THERMAL CHARACTERISTICS OF DISCHARGE-HEATED COOPER VAPOR LASER (DHCVL) HEAT SHIELDS FORMED OF MULTIPLE COAXIAL CYLINDERS
T. W. Alger 10 Jan. 1980 8 p refs Presented at the 1974 Natl. Heat Transfer Conf., Orlando, Fla., 27-30 Jul. 1980
(Contract W-7405-eng-48)
(UCRL-83649, CONF-800723-6) Avail: NTIS HC A02/MF A01

A calculational method for predicting the axial temperature variation of each cylinder of a finite length heat shield formed of multiple coaxial cylinders was developed for longitudinal

discharge, discharge heated copper vapor laser (DHCVL) application. This model includes diffuse gray thermal radiation and axial conduction effects, but it neglects radial conduction and convection. Example calculations for three different possible DHCVL geometries (diameters) are presented to demonstrate the importance of emmissivity, number of included cylinders and the applied heat flux on the plasma tube maximum temperature and the axial temperature profile. Comparison is made between a predicted and a measured DHCVL maximum plasma tube temperature. DOE

N80-32715# Los Alamos Scientific Lab., N. Mex.
EXCIMER LASER TECHNOLOGY
Phillip N. Mace. 1980. 9 p. refs. Presented at 24th SPIE Intern. Symp., San Diego, Calif., 1 Aug. 1980
(Contract W-7405-eng-36)
(LA-UR-80-1427; CONF-800810-1) Avail: NTIS HC A02/MF A01

Scaling presently available excimer laser systems to lasers designed to operate at high average power and high pulse repetition rates for long periods of time is addressed. Key technology issues examined include preionization techniques, energy delivery systems, and system chemistry. The development of pulse power components, optical elements, and flow system components is also covered. DOE

37 MECHANICAL ENGINEERING

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

REDUNDANT MOTOR DRIVE SYSTEM. Patent
John A. Calvert, inventor (to NASA). Issued 5 Aug. 1980. 6 p. Filed 4 Aug. 1978. Supersedes N78-28460 (16 - 19, p. 2534)
(NASA-Case-MFS-23777-1; US-Patent-4,215,592; US-Patent-Appl-SN-931217; US-Patent-Class-74-661; US-Patent-Class-74-425; US-Patent-Class-74-665C; US-Patent-Class-318-15) Avail: US Patent and Trademark Office. CSCL 13I

A drive system characterized by a base supporting a pair of pillars arranged in spaced parallelism, a shaft extended between and supported by the pillars for rotation about the longitudinal axis thereof, a worm gear affixed to the shaft and supported in coaxial relation therewith is described. A bearing housing of a sleeve like configuration is concentrically related to the shaft and is supported thereby for free rotation. A first and a second quiescent drive train, alternatively activatable, is provided for imparting rotation into said bearing housing. Each of the drive trains is characterized by a selectively energizable motor connected to a spur gear. Official Gazette of the U.S. Patent and Trademark Office

N80-32717* National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, Md.
BELT FOR TRANSMITTING POWER FROM A COGGED DRIVING MEMBER TO A COGGED DRIVEN MEMBER. Patent
Hossein Bahiman, inventor (to NASA). Issued 5 Aug. 1980. 4 p. Filed 18 Sep. 1978. Supersedes N78-32435 (16 - 23, p. 3086)
(NASA-Case-GSC-12289-1; US-Patent-4,215,590; US-Patent-Appl-SN-943086; US-Patent-Class-474-205; US-Patent-Class-198-847; US-Patent-Class-198-848) Avail: US Patent and Trademark Office. CSCL 13I

A belt for transmitting power from a cogged driving member to a cogged driven member such as a pair of wheel sprockets is described. The belt has inflexible teeth spaced along the direction of its travel. Each of the teeth has a longitudinal axis transverse to the direction of belt travel. The belt also includes substantially inextensible fasts spaced transversely to the direction of belt travel. The fasts extend in the direction of belt travel adjacent to the teeth and are looped around preselected numbers of the teeth. Official Gazette of the U.S. Patent and Trademark Office

UPGRADED AUTOMOTIVE GAS TURBINE ENGINE DESIGN AND DEVELOPMENT PROGRAM, VOLUME 2. Final Report
C. E. Wagner, ed. and R. C. Pampreen, ed. Jun. 1979. 348 p. refs. Sponsored by NASA
(Contracts EY-76-C-02-2749; EC-77-A-31-1040)
(NASA-CR-159671; DOE/NASA/2749-79/2-Vol-2; COO-2749-43-Vol-2) Avail: NTIS HC A15/MF A01. CSCL 13I

Results are presented for the design and development of an upgraded engine. The design incorporated technology advancements which resulted from development testing on the Baseline Engine. The final engine performance with all retro-fitted components from the development program showed a value of 91 HP at design speed in contrast to the design value of 104 HP. The design speed SFC was 0.53 versus the goal value of 0.44. The miss in power was primarily due to missing the efficiency targets of small size turbomachinery. Most of the SFC deficit was attributed to missed goals in the heat recovery system relative to regenerator effectiveness and expected values of heat loss. Vehicular fuel consumption, as measured on a chassis dynamometer, for a vehicle inertia weight of 3500 lbs., was 15 MPG for combined urban and highway driving cycles. The baseline engine achieved 8 MPG with a 4500 lb. vehicle. Even though the goal of 18.3 MPG was not achieved with the upgraded engine, there was an improvement in fuel economy of 46% over the baseline engine, for comparable vehicle inertia weight. Author

DEVELOPMENT OF FLEXIBLE ROTOR BALANCING CRITERIA. Final Report
Wayne W. Walter and Neville F. Rieger. Mar. 1979. 115 p. refs.
(Grant NsG-3072)
(NASA-CR-159506) Avail: NTIS HC A06/MF A01. CSCL 13I

Several studies in which analytical procedures were used to obtain balancing criteria for flexible rotors are described. General response data for a uniform rotor in damped flexible supports were first obtained for plain cylindrical bearings, tilting pad bearings, axial groove bearings, and partial arc bearings. These data formed the basis for the flexible rotor balance criteria presented. A procedure by which a practical rotor in bearings could be reduced to an equivalent uniform rotor was developed and tested. It was found that the equivalent rotor response always exceeded to practical rotor response by more than sixty percent for the cases tested. The equivalent rotor procedure was then tested against six practical rotor configurations for which data was available. It was found that the equivalent rotor method offered a procedure by which balance criteria could be selected for practical flexible rotors, using the charts given for the uniform rotor. A.R.H.

IMPROVEMENT OF RELIABILITY OF WELDING BY IN-PROCESS SENSING AND CONTROL: DEVELOPMENT OF SMART WELDING MACHINES FOR GIRTH WELDING OF PIPES Progress Report
Jose Converti, Yehuda Dror, David E. Hardt, Koichi Masubuchi, Henry M. Paynter, and William C. Unkel 30 Nov. 1979 42 p refs
(Contract DE-AC02-79ER-10474)
(DOE/ER-10474/1; PR-1) Avail: NTIS HC A03/MF A01

Progress in a research program to improve the reliability of welding by developing a smart welding machine is reported. The machine is equipped with sensors, artificial intelligence, and actuators for reducing welding errors by one or two orders of magnitude. DOE

N80-32725# Virginia Univ., Charlottesville. Dept. of Mechanical and Aerospace Engineering.
ACTIVE FEEDBACK CONTROL FOR STABILIZATION OF VIBRATION IN ROTATING MACHINERY (24.034) Quarterly Technical Report, 1 Apr. - 30 Jun. 1980
Bruce Bakaysa 1980 15 p
(Contract DE-AC01-79ET-13151)
(DOE/ET-13151/T5) Avail: NTIS HC A02/MF A01

Some of the considerations involved in the use of feedback control as a means of reducing the unbalanced response of a rotor or of eliminating or alleviating rotor dynamic instability are discussed. A simple model of a mass on a flexible shaft was used to illustrate the application of feedback control concepts. A description is given of a system which uses feedback control individually adjustable in the vertical and horizontal directions to support the shaft bearings. DOE

N80-32726# International Nickel Co., Inc., Suffern, N. Y. Research and Development Center.
WELD OVERLAYING FOR CORROSION RESISTANCE IN COAL GASIFICATION ATMOSPHERES Quarterly Report, 1 Mar. - 31 May 1979
Edward P. Sadowski 1979 65 p
(Contract ET-77-C-01-2621)
(FE-2621-13) Avail: NTIS HC A04/MF A01

Hardness and tensile testing of weldments exposed to a 1% H2S coal gasification atmosphere for 1000 hours at 982 C was completed. Corrosion evaulation of unwelded specimens of 304L, 310 SS and INCOLOY alloy 800H was also completed. The INCONEL Filler Metal 72 and R139 overlays increased and the AWS-ER309 overlays decreased in hardness after exposure. The welding process used had very little effect on the response of the FM-72 overlays, while R139 deposited by the SAW process had the least increase in hardness. The latter may be associated with the lower Al recovery obtained with the SAW process. Generally, the heat affected zone and base metals of all weldments decreased in hardness after exposure. All weldness decreased in room temperature yield and tensile strength after exposure. Most weldments suffered a decrease in tensile ductility. The 310 weldments had the largest percentage decrease and the 304L weldments the last percentage decrease in the original tensile ductility after exposure. DOE

N80-32727# Idaho National Engineering Lab., Idaho Falls.
CENTRIFUGAL PUMP PERFORMANCE UNDER SIMULATED TWO-PHASE FLOW CONDITIONS
Tien-Hu Chen and William J. Quarp 1980 28 p refs Presented at ASME Century 2 Emerging Technol. Conf., San Francisco, 10 Aug. 1980
(Contract DE-AC07-76ID-01570)
(CONF-800804-7) Avail: NTIS HC A03/MF A01

Test results from centrifugal (mixed-flow) pump performance testing using nitrogen-water flow to simulate steamwater two phase conditions are presented. Capability of the pump model used to analyze the thermal-hydraulic response when applied to a postulated loss-of-coolant accident in a light water reactor is examined. DOE

SOOT REDUCTION IN DIESEL ENGINES BY CATALYTIC EFFECTS
R. Sapienza, T. Butcher, C. Krishna, and J. Gaffney. 1980. 20 p. refs. Presented at 4th Workshop on Catalytic Combust., Cincinnati, 14-15 May 1980; sponsored by EPA.
(Contract DE-AC02-76CH-00016)
(BNL-27792; CONF-800553-2) Avail: NTIS HC A02/MF A01

Small additions of alcohols to the fuel and the presence of platinum surfaces in the combustion chamber can reduce soot emissions in a diesel engine. Tests were conducted over a limited range of operation in a single cylinder CFR engine. Most of the testing was done using pure cetane as a fuel at constant speed and load. Possible major features of the reaction mechanisms for both fuel additives and surface catalyst effectiveness are presented. DOE

N80-32732# Central Inst. for Industrial Research, Oslo (Norway).
CERAMIC COATINGS ON DIESEL ENGINE COMPONENTS Progress Report, Jan. - Aug. 1979
Ingard Kvernes and Karl Peter Lillend. Oct. 1979. 19 p. refs.
(Contract DE-AC03-79ET-15320)
(DOE/ET-15320/T1) Avail: NTIS HC A02/MF A01

The development and testing of ceramic coatings for diesel engine components are discussed. These coatings include oxides of Al, Cr, Zr, Mg, Si, Ti, and Ca, and Mo and Cr carbides. Data on their application and thermodynamic and wear characteristics are presented. Preliminary results show that, relative to valves and piston crowns: stabilized ZrO_2 coating under certain conditions increases the working life of various components; higher combustion temperature may improve the thermal efficiency by increased turbocharger air delivery; reduction in the component temperatures decreases the thermal stresses; the ZrO_2-MgO shows improved corrosion resistance in combustion gases compared to (ZrO_2)(Y_2O_3) and (ZrO_2)(CaO); the limitations of the coatings must be defined in more detail; and the adherence of thicker coatings must be improved. Optimization of the spraying process with respect to particle fusion is necessary. Also, Mo and Cr carbide coatings were found to increase the service life of piston rings. DOE

N80-32733# Porsche (Ferdinand) AG, Stuttgart (West Germany).
REDUCTION OF FUEL CONSUMPTION BY THERMODYNAMIC OPTIMIZATION OF THE OTTO MOTOR: COMPARATIVE INVESTIGATION OF OTTO DIESEL ENGINES
D. Gruden, R. Hahn, and H. Loercher. 1980. 171 p. refs. In GEORGIAN.
(EUR-6711-DE) Avail: NTIS (US Sales Only)HC A08/MF A01; DOE Depository Libraries.

Test on a 2.1 Otto engine for the Porshe 924 demonstrate that by optimizing the compression ratio, combustion chamber shape, fuel air ratio and ignition timing, it is possible to reduce the fuel consumption over the entire load and speed range from 4 to 30% in comparison with the conventional variant, without losing maximum power output. The compression ratio of the new engine is 13.0, and is operated with lean fuel/air mixture in the part load range. The acceleration time from 0 to 100 km/h is 9.7 s for the Otto variant, and 24.7 s for the diesel engine. The fuel consumption of both variants is about identical in mixed traffic conditions (city, road, highway). Exclusively in city driving (ECE-test) the diesel engine has a 9% better fuel consumption than the Otto engine due to its lower idle fuel consumption. At higher speeds (90 and 120 km/h), the fuel consumption of the thermodynamically optimized Otto engine is 2 to 8% lower. DOE

HC A06/MF A01 CSCL 13H

Evaluation of existing extrusive control systems in the plastics industry and analysis of a new method of control are discussed. The term extrusion control system in relation to plastics processing operations includes set point controls for various types of heating and cooling equipment as well as motor speed controls for dc and hydraulic screw drives for digital and microprocessor based electronic systems, machine sequencers for injection and blow molding lines, and feed back loops for sheet thickness and insulation uniformity. The extrusion process is examined: the extrusion operation, analysis of existing control systems, directions for development of a new control system, program modules and linkages, and the alarm handler operation. MINI ARC WELDING/BRAZING TECHNIQUE Final Report
G. L. Cann 31 Mar. 1980 68 p refs
(Grant NSF DAR-79-17748)
(PB80-186497; AMEX-0407; NSF/RA-800048) Avail: NTIS
HC A04/MF A01 CSCL 13H

Feasible applications of the mini-arc technique to competitive electron beam welding, or spot welding are described. This involved establishing the physical principles and processes which occur in all methods of making metal-to-metal or metal-to-ceramic joints. The mini-arc welder precludes the need for flux or other chemical cleaning processes. It operates on several selected materials and configurations. Results were compared to those using electron beam and spot welding. The mini-arc proved superior, sometimes creating welds which other techniques could not match. The mini-arc technique can reduce fabrication costs for selected materials and it is ideally suited for automation in manufacturing processes, especially those involving small dimensions. GRA

RELIABILITY CONSIDERATIONS OF ELECTRONICS COMPONENTS FOR THE DEEP UNDERWATER MUON AND NEUTRINO DETECTION SYSTEM
Branko Leskovar Feb. 1980 20 p refs Presented at the Process Workshop, Honolulu, 11-16 Feb. 1980
(Contract W-7405-eng-48)
(LBL-10548; CONF-800240-1) Avail: NTIS
HC A02/MF A01

The reliability of some electronics components for the Deep Underwater Muon and Neutrino Detection (DUMAND) System is discussed. An introductory overview of engineering concepts and technique for reliability assessment is given. Component reliability is discussed in the context of major factors causing failures, particularly with respect to physical and chemical causes, process technology and testing, and screening procedures. Failure rates for discrete devices and for integrated circuits as well as for basic electronics components are presented. The military reliability specifications and standards for semiconductor devices are reviewed. DOE

WELD EVALUATION ON SPHERICAL PRESSURE VESSELS USING HOLOGRAPHIC INTERFEROMETRY
Donald M. Boyd and William W. Wilcox 14 May 1980 16 p refs Presented at the Fourth Intern. Congr. on Exptl. Mechs., Boston, 26-30 May, 1980
(Contract W-7405-eng-48)
(UCRL-84079; CONF-800575-2) Avail: NTIS
HC A02/MF A01

Waist welds on spherical experimental pressure vessels were evaluated under pressure using holographic interferometry. A coincident viewing and illumination optical configuration coupled with a parabolic mirror was used so that the entire weld region could be examined with a single hologram. Positioning the pressure vessel at the focal point of the parabolic mirror provides a relatively undistorted 360 degrees of view of the waist weld. Double exposure and real time holography were used to obtain displacement information on the weld region. Results are compared with radiographic and ultrasonic inspections. DOE

SCATTERED LIGHT PHOTOELASTIC ANALYSIS OF A PROJECTILE BULKHEAD TO STRUCTURAL CASE JOINT Final Report
Miloslav Benicek and Jiro Adachi Oct. 1979 16 p
(DA Proj. 1X4-64603-D-663)
(AD-A079563; AMMRC-TR-79-54) Avail: NTIS HC A02/MF A01 CSCL 20/11

Photoelastic stress analysis of the bulkhead to structural case pin joint of a projectile was carried out using the scattered light technique. Analysis provided three dimensional stress distributions in critical areas of the joint including the pinhole, pin bearing surfaces, and joint bearing surfaces. Stress gradients through the wall were found to be large; however, stress concentrations were found to be moderate with a maximum value of 3.7.

THEORETICAL STUDIES OF COLUMNS UNDER AXIAL IMPACT AND EXPERIMENTAL VERIFICATION
J. Ari-Gur, T. Weller, and J. Singer Aug. 1979 47 p refs
(TAE-377) Avail: NTIS HC A03/MF A01

The response of clamped columns, axially impacted by a mass, is studied. Rayleigh type beam equations and nonlinear strain displacement relations are assumed for linear-elastic anisotropic materials. The equations are solved by a finite difference approximation; the choice of mesh sizes is discussed, and recommendations for best discretization are given. Comparisons of the results with experiments and with some available analytic results show good correlation. Dynamic buckling criteria are discussed and buckling strains are determined for various columns. The overall response of a column is represented by a relation which yields a dynamic Southwell type relation. A dynamic amplification load factor (DLF) is defined, and parametric studies show that this factor is primarily dependent upon initial geometrical imperfection of the column, its effective slenderness, and the duration of the impulsive loading. E.D.K.

ON THE CONSTITUTIVE LAWS FOR THE LARGE STRAIN CYLINDRICAL DEFORMATIONS OF SHELLS
Avinoam Libai and J. G. Simmonds (Virginia Univ.) May 1979 30 p refs
(TAE-370) Avail: NTIS HC A03/MF A01

Expressions are developed for the strain energy and stress resultants in the case of large strain-large bending cylindrical deformations of shells of nonlinear materials. The deformation variables are the extension and curvature of the material reference surface. The Mooney material is used as an example where appropriate. The influence of the large deformations on the constitutive laws is evaluated. Of special interest is the effect of cross terms and of the ability to express the stress resultants as partial derivatives of the strain energy with respect to appropriate deformation variables. FRACTURE TOUGHNESS TESTING OF HDPE PLASTIC PIPE
Peter Flueeler (Swiss Federal Labs. for Testing Materials and Research, Duebendorf), Daniel R. Roberts, John F. Mandell, and Frederick J. McGarry Nov. 1979 30 p refs Sponsored by Agency for International Development
(MIT-CE-R79-5) Avail: NTIS HC A03/MF A01

A program to investigate the applicability of fracture toughness test methods to high density polyethylene pipe is described. Fracture toughness test specimens cut from pipe material were tested in a precracked three point bending test at different rates. The load vs crack opening displacement record was used in an attempt to judge the validity of the test and to determine the fracture load. This method appears to need further development for this class of materials as the results were difficult to interpret. Use of the maximum force for tests which appeared to fail in a quasi-brittle manner resulted in calculation of a fracture toughness value. This value was used to predict the burst pressure of pipes containing surface cracks in the longitudinal direction. The prediction of burst pressure was slightly conservative, but in agreement with the trend of the experimental results. Fractographic analysis indicates three modes of crack propagation: ductile, quasi-brittle, and brittle. Author

STATISTICAL ENERGY ANALYSIS OF COMPLEX STRUCTURES, PHASE 2 Final Report
R. W. Trudell and L. I. Yano Sep. 1980 78 p refs
(Contract NAS8-33191)
(NASA-CR-161576; MDC-G9203) Avail: NTIS HC A05/MF A01 CSCL 20K

A method for estimating the structural vibration properties of complex systems in high frequency environments was investigated. The structure analyzed was the Materials Experiment Assembly, (MEA), which is a portion of the OST-2A payload for the space transportation system. Statistical energy analysis (SEA) techniques were used to model the structure and predict the structural element response to acoustic excitation. A comparison of the intial response predictions and measured acoustic test data is presented. The conclusions indicate that: the SEA predicted the response of primary structure to acoustic excitation over a wide range of frequencies; and the contribution of mechanically induced random vibration to the total MEA is not significant.

THE METHOD OF LINES IN THREE DIMENSIONAL FRACTURE MECHANICS
John Gyekenyesi and Laszlo Berke Washington 1980 19 p refs Presented at the Intern. Symp. on Absorbed Specific Energy and/or Strain Energy Density Criterion, Budapest, 17-19 Sep. 1980; sponsored by Lehigh Univ. and the Hungarian Acad. of Sci.
(NASA-TM-81593; E-576) Avail: NTIS HC A02/MF A01 CSCL 20K

A review of recent developments in the calculation of

design parameters for fracture mechanics by the method of lines (MOL) is presented. Three dimensional elastic and elasto-plastic formulations are examined and results from previous and current research activities are reported. The application of MOL to the appropriate partial differential equations of equilibrium leads to coupled sets of simultaneous ordinary differential equations. Solutions of these equations are obtained by the Peano-Baker and by the recurrance relations methods. The advantages and limitations of both solution methods from the computational standpoint are summarized. R.K.G.

NEWTON'S METHOD: A LINK BETWEEN CONTINUOUS AND DISCRETE SOLUTIONS OF NONLINEAR PROBLEMS
Gaylen A. Thurston *In its* Res. in Nonlinear Struct. and Solid Mech. 1980 p 27-46 refs (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

Newton's method for nonlinear mechanics problems replaces the governing nonlinear equations by an iterative sequence of linear equations. When the linear equations are linear differential equations, the equations are usually solved by numerical methods. The iterative sequence in Newton's method can exhibit poor convergence properties when the nonlinear problem has multiple solutions for a fixed set of parameters, unless the iterative sequences are aimed at solving for each solution separately. The theory of the linear differential operators is often a better guide for solution strategies in applying Newton's method than the theory of linear algebra associated with the numerical analogs of the differential operators. In fact, the theory for the differential operators can suggest the choice of numerical linear operators. In this paper the method of variation of parameters from the theory of linear ordinary differential equations is examined in detail in the context of Newton's method to demonstrate how it might be used as a guide for numerical solutions. Lightweight aircraft structures exposed to a high intensity noise environment can fatigue prematurely if adequate consideration is not given to the problem. Design methods and design criteria for sonic fatigue prevention were developed based on analytical and experimental techniques. Most of the analytical work was based upon small deflection or linear structural theory which did not agree with the experimental results. A large deflection geometrical nonlinearity was incorporated into the analysis methods for determining the structural response to high intensity noise. The Karman-Herrmann large deflection equations with a single mode Galerkin approximation, and the method of equivalent linearization were used to predict mean square amplitude, mean square stresses, and nonlinear frequency at various acoustic loadings for rectangular panels. Both simply supported and clamped support conditions with immovable or movable inplane edges are considered. Comparisons with experimental results are presented. E.D.K.

POST-BUCKLING BEHAVIOR OF A BEAM-COLUMN ON A NONLINEAR ELASTIC FOUNDATION WITH A GAP
Edward N. Kuznetsov and Thomas G. Johns (Battelle Houston Operations, Tex.) *In* NASA. Langley Research Center. Res. in Nonlinear Struct. and Solid Mech. 1980 p 165-173 refs Sponsored by American Gas Association Pipeline Research Committee (For primary document see N80-32756 23-39)
Avail: NTIS CSCL 20K

The structural behavior of an elastic beam-column placed with a gap between two nonlinearity elastic layers each resting on a rigid foundation was examined. The beam-column was laterally supported at both ends and subjected to a uniform transverse load and axial compression. Its slenderness was such that the axial compressive force exceeds the amount that would be necessary to buckle it as a simple supported column. The elastic layers were represented by an elastic foundation with a strongly nonlinear specific reaction taken as a rapidly increasing function of the layer compression. The analytical model developed simulated the entire pattern of the deflection and stress state including layer and end support reactions, under gradually increasing axial force. R.C.T.

STRAIGHTENING OF A WAVY STRIP: AN ELASTIC-PLASTIC CONTACT PROBLEM INCLUDING SNAP-THROUGH
Dieter F. Fischer and Franz G. Rammerstorfer. *In* NASA. Langley Research Center. Res. in Nonlinear Struct. and Solid Mech. 1980 p 175-185 refs (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

The nonlinear behavior of a wave like deformed metal strip during the levelling process were calculated. Elastic-plastic material behavior as well as nonlinearities due to large deformations were considered. The considered problem lead to a combined stability and contact problem. It is shown that, despite the initially concentrated loading, neglecting the change of loading conditions due to altered contact domains may lead to a significant error in the evaluation of the nonlinear behavior and particularly to an underestimation of the stability limit load. The stability was examined by considering the load deflection path and the behavior of a load-dependent current stiffness parameter in combination with the determinant of the current stiffness matrix. SOLUTIONS OF CONTACT PROBLEMS BY THE ASSUMED STRESS HYBRID MODEL
Kenji Kubomura and Theodore H. H. Pian (MIT, Cambridge) *In* NASA. Langley Research Center Res. in Nonlinear Struct. and Solid Mech. 1980 p 211-224 refs (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

A method was developed for contact problems which may be either frictional or frictionless and may involve extensive sliding between deformable bodies. It was based on an assumed stress hybrid approach and on an incremental variational principle for which the Euler's equations of the functional include the equilibrium and compatibility conditions at the contact surface. The tractions at an assumed contact surface were introduced as Lagrangian multipliers in the formulation. It was concluded from the results of several example solutions that the extensive sliding contact between deformable bodies can be solved by the present method. R.C.T.

FINITE ELEMENTS FOR CONTACT PROBLEMS IN TWO-DIMENSIONAL ELASTODYNAMICS
Thomas K. Zimmermann and Wing Kam Liu (California Inst. of Tech., Pasadena) *In* NASA. Langley Research Center Res. in Nonlinear Struct. and Solid Mech. 1980 p 225-235 refs (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

A finite element approach for contact problems in two dimensional elastodynamics was proposed. Sticking, sliding, and frictional contact were taken into account. The method consisted of a modification of the shape functions, in the contact region, in order to involve the nodes of the contacting body. The formulation was symmetric (both bodies were contactors and targets), in order to avoid interpenetration. Compatibility over the interfaces was satisfied. The method was applied to the impact of a block on a rigid target. It is shown that the formulation can be applied to fluid structure interaction, and to problems involving material nonlinearity. INELASTIC BEHAVIOR OF STRUCTURAL COMPONENTS
Noor Hussain, K. Khozeimeh, and T. G. Toridis *In* NASA. Langley Research Center Res. in Nonlinear Struct. and Solid Mech. 1980 p 237-250 refs (For primary document see N80-32756 23-39)
(Grant NSF PFR-79-16263)
Avail: NTIS HC A13/MF A01 CSCL 20K

A more accurate procedure was developed for the determination of the inelastic behavior of structural components. The actual stress-strain curve for the mathematical of the structure was utilized to generate the force-deformation relationships for the structural elements, rather than using simplified models such as elastic-plastic, bilinear and trilinear approximations. relationships were generated for beam elements with various types of cross sections. In the generational of these curves, stress or load reversals, kinematic hardening and hysteretic behavior were taken into account. Intersections between loading and unloading branches were determined through an iterative process. Using the inelastic properties obtained, the plastic static response of some simple structural systems composed of beam elements was computed. Results were compared with known solutions, indicating a considerable improvement over response predictions obtained by means of simplified approximations used in previous investigations. R.C.T.

NONLINEAR FINITE ELEMENT ANALYSIS: AN ALTERNATIVE FORMULATION
Silvio Merazzi and Peter Stehlin (Aeronautical Research Inst. of Sweden, Stockholm) *In* NASA. Langley Research Center Res. in Nonlinear Struct. and Solid Mech. 1980 p 251-261 refs Sponsored in part by Swiss National Science Foundation and National Swedish Board for Energy Source Development (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

A geometrical nonlinear analysis based on an alternative definition of strain is presented. Expressions for strain are obtained by computing the change in length of the base vectors in the curvilinear element coordinate system. The isoparametric element formulation is assumed in the global Cartesian coordinate system. The approach is based on the minimization of the strain energy, and the resulting nonlinear equations are solved by the modified Newton method. Integration of the first and second variation of the strain energy is performed numerically in the case of two and three dimensional elements. Application is made to a simple long cantilever beam. COROTATIONAL VELOCITY STRAIN FORMULATIONS FOR NONLINEAR ANALYSIS OF BEAMS AND AXISYMMETRIC SHELLS
Ted Belytschko, H. Stolarski (Polish Academy of Sciences, Warsaw), and C. S. Tsay *In* NASA. Langley Research Center Res. in Nonlinear Struct. and Solid Mech. 1980 p 263-276 refs Sponsored by Electric Power Research Inst. (For primary document see N80-32756 23-39)
Avail: NTIS HC A13/MF A01 CSCL 20K

Finite element formulations for large strain, large displacement problems are formulated using a kinematic description based on the corotational components of the velocity strain. The corotational components are defined in terms of a system that rotates with each element and approximates the rotation of the material. To account for rotations of the material relative to this element system, extra terms are introduced in the velocity strain equations. Although this formulation is incremental, in explicitly integrated transient problems it compares very well with formulations that are not. R.C.T.

HC A03/MF A01 CSCL 20/11

Experiments were conducted to determine the shear strains and strain rates in adiabatic shear bands in a Ni-Cr steel (rolled armor). An explosively driven mass was used to punch plugs from plate of the steel and, thereby, create adiabatic shear bands. There were originally planes of chemical inhomogeneity (reference bands) in the plane of the steel samples. The slopes of the reference bands were altered by the plastic shear, and they were, therefore, a measure of the plastic shear strain. From measurements of the slopes of the reference bands, it was found that the plastic shear was approximately an exponential function of distance through an adiabatic shear band. Shear strains of at least 572 developed after the onset of adiabatic shear. The results suggest how heating occurs within the shear bands, the maximum temperatures attained and the related strength degradation associated with the development of an adiabatic shear band. GRA

Ongoing inhouse work on the measurement of residual stress in Army Materiel by both X-ray and strain gage mechanical relaxation methods is presented and compared. The X-ray portion includes problems associated with the calculation of stresses in highly textured samples while the strain gage portion describes effects produced by various mechanical methods to partially relieve the strain fields sensed by the active gage elements. Comparisons are also made of the errors introduced by considering the active element in the strain gage rosette as a point gage instead of one with finite length. GRA

The volume of the research effort currently under way to characterize the constitution of thermoelastic plastic creep materials is ample evidence of its importance. Although significant work has been done to obtain working constitutive models, in many cases the theory has not been cast with the remaining field equations into a working continuum model. In this paper, the author will consider models from classical plasticity and nonlinear viscoelasticity theory for applicability to the conservation of momentum. Based on physical accuracy as well as computational efficiency the author will assess the feasibilty of further development of each model. GRA

HC A04/MF A01 CSCL 13/5

The introduction of inertia terms in the theoretical model of thin ring expansion shows that classical plastic instability concepts, defined in terms of the local strain in the necking region, no longer apply. However, in this report it is shown that, when the plastically incompressible constitutive model is replaced with a model applicable to porous plastic materials, a criterion based on critical void volume fraction provides an alternative means to predict failure. The theory also provides a method in which both geometric and metallurgical imperfections in a given sample might be considered. The application of this theory to thin ring specimens was used to confirm that the critical void growth concept predicts the uniform strain at failure as observed in aluminum and copper rings, under both quasi-static and high strain-rate loading conditions. A HIGH-SENSITIVITY POTENTIAL-DROP TECHNIQUE FOR FATIGUE CRACK GROWTH MEASUREMENTS
Graham Clark. Aug. 1979. 40 p. refs
(AD-A088278; MRL-R-755; AR-001-837) Copyright. Avail: NTIS HC A03/MF A01 CSCL 20/11

This report describes the design features of a highly sensitive and accurate system for monitoring the growth of fatigue cracks in laboratory specimens of various geometries. The system is based on the potential drop method which utilizes the electrical resistance changes associated with fatigue crack growth through the specimen cross section to detect crack length increments of a few micrometers. The technique is suitable for automation, and tests may be completed with a minimum amount of operator interference. A computer based data processing method is described, and the performance of the system in measuring both absolute crack length and crack growth rate is evaluated. GRA

(AD-A087961; SWRI-02-4268) Avail: NTIS
HC A04/MF A01 CSCL 11/6

The effects of a water vapor environment on crack tip plasticity in low-carbon steel have been further examined. Strains in the plastic zone, as determined by stereoimaging, have been used to compute stresses at the same locations, and an estimate of the energy expended for creation of new crack area may also be computed using the same strains. These values are compared with similar information derived previously using plastic zone subgrain size distributions as determined by electron channeling. There is general agreement between the data determined by the two techniques. A model is offered for including the effects of water vapor upon crack tip plasticity into the damage accumulation analysis of fatigue crack propagation. A critical discussion is also given of the findings to date on the effects of environment on crack tip plasticity, and it is concluded that those findings may be explained by changes in the material properties very close to the crack tip, rather than in the bulk of the plastic zone. A PHOTOELASTOPLASTIC STUDY OF STRESS CONCENTRATION FACTORS AND RESIDUAL STRESSES IN TWO NOTCHED SPECIMENS OF POLYCARBONATE MATERIAL
Y. F. Cheng May 1980 30 p refs
(AD-A088538; AD-E440084; ARLCB-TR-80025) Avail: NTIS HC A03/MF A01 CSCL 20/11

A photoelastoplastic study on stress concentrations, in elastic as well as in elastoplastic states, in a C-shaped specimen and a compact tensile specimen of polycarbonate material has been made. The principles of the experimental method are outlined, equations for nominal stresses are given, and stress concentration factors are determined. Residual stresses after unloading are calculated by making the usual assumption that unloading is an elastic process. In the elastic state, stress concentration factors are readily applicable to specimens of any material with similar geometry and loading. In the elastoplastic state, it requires the similarity of stress strain relation between model and prototype materials. GRA

MEAN WIND FORCES ON PARABOLIC-TROUGH SOLAR COLLECTORS
J. A. Peterka (Colorado State Univ.), J. M. Sinau (Colorado State Univ.), and J. E. Cermak (Colorado State Univ.) May 1980 121 p refs
(Contract DE-AC04-76DP-00789)
(SAND-80-7023) Avail: NTIS HC A06/MF A01

Characteristics of mean wind loads produced by airflow in and around several configurations of parabolic trough solar collectors with and without a wind fence are discussed. Four basic parabolic shapes were investigated as single units and one shape was studied as part of several array fields. One scale model of each parabolic shape was constructed for mounting on a force balance to measure two forces and three moments. The effects of several dominant variables were investigated in this study: wind-azimuth (or yaw), trough elevation (or pitch) angle, array field configuration, and protective wind fence characteristics. All measurements were made in a boundary layer flow. DOE

APPROXIMATION OF FINITE ELEMENT NODAL POINT STRESSES FOR NONLINEAR MATERIAL MODELS
B. R. Bass, W. G. Johnson, and S. V. McGrath 28 Feb. 1980 44 p refs
(Contract W-7405-eng-26)
(K/TS-3798) Avail: NTIS HC A03/MF A01

A computational scheme is described for approximating elastic-plastic stress components at the nodal points of finite element grids. The method is based on a local least squares smoothing technique and a well known incremental plasticity model. During each load step of the materially nonlinear analysis, strain values at the Gauss integration points are extrapolated to the nodes; the incremental change in strains at the nodes is then determined from previously stored nodal strain values. The increment in nodal stresses is calculated from the incremental elastic-plastic stress-strain relations for the nodes and added to the nodal stresses computed in the previous update. An application of the scheme to the analysis of a thin bellows under compressive loading is discussed; the results are compared with those obtained from using a different nodal stress technique. DOE

FINITE ELEMENT ANALYSIS FOR THE INITIATION OF LAMELLAR TEARING IN WELDED JOINTS
Raymond D. Krieg and Robert K. Thomas 1980 23 p refs Presented at the ASME Century 2 Emerging Technol. Conf., San Francisco, 10 Aug. 1980
(Contract DE-AC04-76DP-00789; AT(29-1)-789)
(SAND-79-1891C; CONF-800804-10) Avail: NTIS HC A02/MF A01

A numerical procedure using the finite element method is presented for predicting the initiation of lamellar tearing in fillet welded T-joints commonly employed in large structures. Starting with a prescribed geometry, the welding process is approximated by a known time dependent volumetric heat source which simulates the arc heating and deposition of liquid metal. The transient nonlinear thermal and stress problems are then solved using finite element computer codes. Results of the elastic-plastic stress analysis are presented showing a predicted region of incipient lamellar tearing based on a ductile fracture theory which qualitatively agrees with the size and location of tears typically observed in photomicrographs. Additional insight into post failure crack lengtrh and stability is presented based on a simplified linear elastic fracture mechanics approach. Although the analysis procedure shows signs of promise, several weak points in the model are pointed out which must be improved before lamellar tearing can be quantified in an approach of this general type. DOE

N80-32793# Sandia Labs., Albuquerque, N. Mex. Applied Mechanics Div.
CONSISTENT STRESS-STRAIN DUCTILE FRACTURE MODEL AS APPLIED TO TWO GRADES OF BERYLLIUM
T. G. Priddy, S. E. Benzley, and L. M. Ford. 1980. 46 p. refs.
(Contracts DE-AC04-76DP-00789; AT(29-1)-789)
(SAND-79-2126) Avail: NTIS. HC A03/MF A01

Published yield and ultimate biaxial stress and strain data for two grades of beryllium are correlated with a more complete method to characterizing macroscopic strain at fracture initiation in ductile materials. Results are compared with those obtained from an exponential, mean stress dependent model. Simple statistical methods are employed to illustrate the degree of correlation for each method with the experimental data. DOE

N80-32794# Los Alamos Scientific Lab., N. Mex.
PLASTIC DEFORMATION OF COLLIDING HEMISHELLS
David C. Moir and Timothy R. Neal. 1980. 13 p. ref. Presented at the Intern. Conf. on the Met. Effects of High Strain-Rate Deformation and Fabric., Albuquerque, N. Mex., 22-26 Jun. 1980.
(Contract W-7405-eng-36)
(LA-UR-80-1659; CONF-800641-4) Avail: NTIS. HC A02/MF A01

The collision of two hemishells is analyzed where one hemishell is clamped and the other impinges on the inner surface of the clamped hemishell. A model of rigid perfectly plastic behavior is proposed for the flow of material in the region of contact. An expression relating velocity and deformation is obainted and compared with the results of experiments. DOE

NEW METHOD TO DETERMINE THE INDEPENDENT SHEAR MODULI OF TRANSVERSELY ISOTROPIC MATERIALS
K. P. Chong, J. L. Chen, K. Uenishi, and J. W. Smith. 1980. 15 p. refs. Presented at the 4th SESA Intern. Congr. on Exptl. Mech., Boston, 25-30 May 1980.
(Contract DE-AT20-80LC-10224)
(CONF-800575-1) Avail: NTIS. HC A02/MF A01

A simple method is presented to determine the independent shear moduli of transversely isotropic materials. The method is tested on Green River Formation oil shale, one of such materials. The method is applicable for linear and nonlinear elastic materials. Mathematical formulation, derivation and solution are given, and test apparatus and results are presented. Comparison with other approximate results and acoustical methods are made. Confirmation of the test method with materials having known shear moduli is also presented. DOE

N80-32797# California Univ., Livermore. Lawrence Livermore Lab.
TECHNIQUE FOR STUDYING MULTIPLE FRACTURES PRODUCED AT INTERMEDIATE LOADING RATES
R. P. Swift and A. S. Kusubov. 4 Apr. 1980. 18 p. refs. Presented at the Rock Mech. Symp., Rolla, Mo., 28-30 May 1980.
(Contract W-7405-eng-48)
(UCRL-83653; CONF-800507-6) Avail: NTIS. HC A02/MF A01

A laboratory experimental technique was developed to study the effects of pressurizing the borehole of rock samples with tailored pulses at intermediate loading rates. The experimental apparatus provides sample confinement to 50 Mpa pressure, borehole pressures up to 200 MPa with loading rates from 0.01 to 100 MPa/ms, and pulse durations on the order of 1 to 50 ms. Observations from tests on a dense quartz sandstone under ambient confinement of 0.1 MPa are as follows: for static loading with oil, the breakdown pressure is about 21 MPa and two fractures oriented at 180 deg. are produced; for loadings with water at rates of about 10 MPa/ms, the breakdown pressure increases to about 30 MPa and multiple fractures are created; and for loading rates between 50 to 90 MPa/ms, the breakdown pressure increases to 35 MPa and there is an increase in the number of initiated fractures. DOE

BIAXIAL CREEP-FATIGUE BEHAVIOR OF MATERIALS FOR SOLAR THERMAL SYSTEMS
S. Majumdar. May 1980. 36 p. refs.
(Contract W-31-109-eng-38)
(ANL-80-34) Avail: NTIS HC A03/MF A01

Biaxial creep fatigue data for Incoloy 800 and Type 316H stainless steel at elevated temperatures are presented. Tubular specimens were subjected to constant internal pressure and strain controlled axial cycling with and without hold times in tension as well as in compression. The results show that the internal pressure affects diametral ratchetting and axial stress range significantly. However, the effect of a relatively small and steady hoop stress on the cyclicfife of the materials is minimal. A 1 min compressive hold per cycle does not seriously reduce the fatigue life of either material; a tensile hole of equal duration causes a significant reduction in life for Type 316H stainless steel, but none for Incoloy 800. Fracture surfaces of specimens made of both materials were studied by scanning electron microscopy to determine the reason for the difference in behavior. DOE

IN-REACTOR FATIGUE CRACK PROPAGATION
A. M. Ermi, D. A. Mervyn, and J. L. Straalsund. Aug. 1979. 15 p. Presented at 8th Symp. on Eng. Probl. of Fusion Res., San Francisco, 13-16 Nov. 1979.
(Contract EY-76-C-14-2170)
(HEDL-SA-1927; CONF-791102-158) Avail: NTIS HC A02/MF A01

An in-reactor fatigue experiment designed to determine the effect of dynamic irradiation on the fatigue crack propagation (FCP) behavior of candidate fusion first wall materials is described. The experiment utilizes miniature center-cracked tension specimens developed specifically for in-reactor studies. In the test, a chain of eight specimens, precracked to various initial crack lengths, is stressed during irradiation to determine crack growth rate as a function of stress intensity. Load levels were chosen which result in small crack growth rates encompassing a regime of the crack growth curve not previously investigated during irradiation studies of FCP. Detailed design of the experiment is presented along with crack growth data obtained from prototypic testing of the experimental apparatus. These results are compared to data obtained under similar conditions generated by conventional test methods. DOE

EARTH'S ROTATION IN 1975-1979 BASED ON DOPPLER SATELLITE OBSERVATIONS. Final Report
Richard J. Anderle. May 1980. 59 p. refs.
(AD-A088095; NSWC/TR-80-232) Avail: NTIS HC A04/MF A01 CSCL 03/3

Doppler observations of Navy Navigation Satellites have been used to determine changes in Earth's rotation during the years 1975-1979. Annual and semiannual variations determined from the Doppler observations are not valid due to the neglect of the gravitational effects of atmospheric and ocean tides on the orbit of a satellite. However, variations with periods of 50 to 120 days are correlated well with astronomic results. These variations integrate to amplitudes of two or more milliseconds in UT-1. Shorter period variations only occasionally correlate with astronomic results. There are also occasional conflicts in phases, and, generally, there is only about a 50 percent agreement in amplitude of the shorter period variations obtained from observations of different satellites. GRA

43 EARTH RESOURCES

The author has identified the following significant results. Relationships between the quantity of mixed prairie rangelenad vegetation and LANDSAT MSS response were studied during four growing seasons at test sites throughout the United States Great Plains region. A LANDSAT derived parameter, the normalized difference was developed from theoretical considerations fro statistical estimation of the amount and seasonal condition of rangeland vegetation. This parameter was tested for application to local assessment of green forage biomass and regional monitoring of range feed conditions and drought. Results show that for grasslands in the Great Plains with near continuous vegetative cover and free of heavy brush and forbs, the LANDSAT digital data can provide a useful estimate of the quantity of green forage biomass (within 250 kg/ha), and at least five levels of pasture and range feed conditions can be adequately mapped for extended regions.

The combined effect of water carved gullies, varying soil color, moisture state of the soil and crop, nonuniform phenology, and bare spots was measured for commercially grown barley planted on varying terrain. For all but the most rugged terrain, over 80% of the area within 4, 16, 65, and 259 ha cells was at temperatures within 3 C of the mean cell temperature. The result of using relatively small, 4 ha instantaneous field of views for remote sensing applications is that either the worst or the best of conditions is often observed. There appears to be no great advantage in utilizing a small instantaneous field of view instead of a large one for remote sensing of crop canopy temperatures. The two alternatives for design purposes are then either a very high spatial resolution, of the order of a meter or so, where the field is very accurately temperature mapped, or a low resolution, where the actual size seems to make little difference.

Procedures developed to identify and assess potential environment impacts of advanced mining technology as it moves from a generic concept to a more systems definition are described. Two levels of assessment are defined in terms of the design stage of the technology being evaluated. The first level of analysis

is appropriate to a conceptual design. At this level it is assumed that each mining process has known and potential environmental impacts that are generic to each mining activity. By using this assumption, potential environmental impacts can be identified for new mining systems. When two or more systems have been assessed, they can be evaluated comparing potential environmental impacts. At the preliminary stage of design, a systems performance can be assessed again with more precision. At this level of systems definition, potential environmental impacts can be analyzed and their significane determined in a manner to facilitate comparisons between systems. At each level of analysis, suggestions calculated to help the designer mitigate potentially harmful impacts are provided. A.R.H.

GEOCHEMISTRY OF SOME BRAZILIAN RIVERS
L. M. Moreira-Nordemann. Jun. 1980. 17 p. refs. Submitted for publication.
(INPE-1797-RPE/167) Avail: NTIS HC A02/MF A01
Concentrations of the totality of the dissolved salts and of sodium, calcium, potassium, magnesium and uranium were measured in ten rivers belonging to three hydrographic basins located in northeastern Brazil. Activity ratios U234/U238 were also measured. A correlation between the results obtained and the geological and climatic context of these regions was computed. Sodium is the most abundant element in the waters, except for rivers flowing in calcareous regions for which calcium is predominant. The concentrations of the major cations seem to be a function of the regional lithology whereas water salinity depends on climatic factors. R.K.G.

COLLECTION, PROCESSING, AND DISTRIBUTION OF REMOTE SENSING DATA FROM BRAZILIAN RECEIVING STATION
Nelson deJesusParada. Jun. 1980. 18 p.
(INPE-1784-RPE/156) Avail: NTIS HC A02/MF A01
Basic information about the Brazilian LANDSAT tracking, receiving, processing and distribution system operated by INPE the Cachoeira Paulista Electronic and Photographic Processing Laboratory and Distribution Center. The increase of the users community - with more than 1,200 participant organizations - and the increase of the volume of images produced - near 20,000 in 1979 - are effective demonstration of the importance of remote sensing in Brazil. Types and prices of products available, product request and related items are discussed. Also, the already planned future achievements of the Brazilian Remote Sensing Satellite Program are briefly described. R.K.G.

N80-32833# Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil).
PLANNING AND EXECUTION OF A PHOTOGRAPHIC MISSION OVER A WHEAT PRODUCING REGION IN RIO GRANDE DO SUL, BRAZIL
Paulo Cesar Gurgel deAlbuquerque and Dal Arthur Cottrell. Jun. 1980. 11 p.
(INPE-1793-RPE/165) Avail: NTIS HC A02/MF A01
A wheat survey program was completed with the execution of a photographic mission during the booting growth stage of wheat. Three 20 km. by 40 km. target areas in Rio Grande do Sul were flown after cost/time saving changes in aircraft, oxygen requirements, geometric parameters and base of operations. A WILD RC-10 metric camera with WRATTEN filter was used to expose color IR film to produce 1:20,000 scale transparencies and semicontrolled mosaics for hectareage estimations and data integration with hardware for CCT analyses. R.K.G.

N80-32834# Instituto de Pesquisas Espaciais, Sao Paulo (Brazil).
GEOCHEMICAL BALANCE OF THE SALGADO RIVER BASIN
L. M. Moreira-Nordemann and D. Nordemann. Aug. 1980. 43 p. refs. Submitted for publication.
(INPE-1849-RPE/206) Avail: NTIS HC A03/MF A01
The Salgado River basin (Bahia State, Brazil) was studied from the point of view of present climatic and geochemical conditions: inappropriate exploitation, irregular rainfall and high evaporation rate resulting in a state of unbalanced geochemical conditions. The water of the Salgado River showed high concentration of the total dissolved salts. The mean chemical composition and weathering rate of the rocks of the river basin were measured. S.F.

N80-32835# Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil).
CHARACTERIZATION OF CERRADO VEGETATION USING AUTOMATICALLY CLASSIFIED LANDSAT MSS DATA
Joao Roberto Dos Santos, Vitor Celso DeCarvalho, and Hideyo Aoki (Sao Paulo Univ.). Jun. 1980. 13 p. refs. Presented at the 14th Intern. Symp. on Remote Sensing of Environ., San Jose, Costa Rica, 23-30 Apr. 1980.
(INPE-1790-RPE/162) Avail: NTIS HC A02/MF A01
The characterization of physiognomic unities of cerrado vegetation through automatic IMAGE 100 analysis of LANDSAT MSS data was studied. The separability of the unities analyzed was verified (cerrado, campo cerrado, campo sujo) from respective spectral signatures obtained using a MAXVER and a JM distances algorithm. A correlation analysis of correctly classified values was performed. The results obtained include the following: (1) the use of four channels together presented the best class separation, independent of season; (2) in considering the use of isolated channels, channel 5 provided the largest percent correct classification; and (3) the highest separability was observed between cerrado and campo sujo forms. It is concluded that the separability of physiognomic unities can contribute to studies for the rational use of cerrado areas. R.K.G.

N80-32836# Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil).
THE USE OF LANDSAT DATA FOR EVALUATION AND CHARACTERIZATION OF DEFORESTED PASTURELAND AND REFORESTED AREAS IN BRAZIL
Pedro Hernandez Filho, Armando Pacheco Dossantos, Evlyn Marcia Leao DeMoraesNovo, Yosio Edemir Shimabukuro, Valdete Duarte, Jose Simeao deMedeiros, Eduardo Carlos Mignone Alves, and Carlito Chefer deSantana Jun 1980 9 p refs Presented at the 14th Intern. Symp. on Remote Sensing of Environ., San Jose, Costa Rica, 23-30 Apr 1980 Prepared in cooperation with Brazilian Inst. for Forest Development, Sao Jose dos Campos
(INPE-1794-RPE/166) Avail: NTIS HC A02/MF A01
The compatibility of using LANDSAT data for pastureland and reforestation studies was studied. The degradation of pastureland after deforestation was identified automatically using four indicators: the percentages of exposed soil, lateritic soil, types of juquira and Gramineae species. Pine and eucalypt plantations were identified manually and automatically. The classification accuracy is 94.31 percent for pine and ranges from 67 23 to 92.30 percent for eucalypt. S.F.

N80-32837# Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil).
REMOTE SENSING APPLIED TO THE PROSPECTING OF GEOTHERMAL ANOMALY IN CALDAS NOVAS COUNTY, STATE OF GOIAS, BRAZIL
Paulo Veneziani and Celio Eustaquio DosAnjos Jun 1980 6 p refs Presented at the 14th Intern. Symp. on Remote Sensing of Environ., San Jose, Costa Rica, 23-30 Apr. 1980
(INPE-1792-RPE/164) Avail: NTIS HC A02/MF A01
Thermally anomalous areas associated with hot waters in the County of Caldas Novas, State of Goias, Brazil were studied. Data collection using a 50 cm soil thermometer and a Precision Radiation Thermometer indicated the presence of four principal anomalies. These areas were verified in the field. In the area of the town of Caldas Novas, of 14 deep wells drilled, none revealed water temperatures from 33 to 41 C, two contained hot mud, and one contained sulfurous water measured at 29 C. Two day wells were also encountered. L.F.M.

ON EXTRACTING BRIGHTNESS TEMPERATURE MAPS FROM SCANNING RADIOMETER DATA
P. Argentiero and Raul Garza-Robles Aug 1980 27 p refs Submitted for publication
(NASA-TM-81989) Avail: NTIS HC A03/MF A01 CSCL 08B
The extraction of brightness temperature maps from scanning radiometer data is described as a typical linear inverse problem. Spatial quantization and parameter estimation is described and is suggested as an advantageous approach to a solution. Since this approach takes into explicit account the multivariate nature of the problem, it permits an accurate determination of the most detailed resolution extractable from the data as well as explicitly defining the possible compromises between accuracy and resolution. To illustrate the usefulness of the method described for algorithm design and accuracy prediction, it was applied to the problem of providing brightness temperature maps during the NOSS flight segment. The most detained possible resolution was determined and a curve which displays the possible compromises between accuracy and resolution was provided. Author

HORIZONTAL DATUMS FOR NAUTICAL CHARTS
Thomas J. Vogel Jul 1980 23 p
(AD-A088340) Avail: NTIS HC A02/MF A01 CSCL 08/5
Marine navigation charts are based on many and varied geodetic datums in use throughout the world. These datums range from local datums to the DoD World Geodetic System (WGS) 1972. In many cases, the datums for adjoining charts will differ, although this difference will usually introduce only minor errors into the solution of navigational problems. There are times, however, when even small errors can be very disconcerting, if not dangerous, and it is under these conditions that it is advantageous for the navigator to possess some knowledge of the factors in datum selection and chart construction which lead to apparent discrepancies in position plotting. It is equally important for the chart compiler or cartographer to understand the basic principles of navigation and, therefore, the need for establishing clearly definable horizontal datums on charts. For this reason, the author has aimed at tracing the evolution of datums on Defense Mapping Agency (DMA) nautical charts, mainly for the benefit of cartographers who must realize how the product they produce impacts on the safety of navigation in ways other than the portrayal of up to date information such as navigation aids, depths, etc. This paper discusses the differences between chart datums and coordinates determined by using various navigation systems, accuracy requirements for nautical charts, navigation system accuracy requirements as related to datums, and datum transformation methods. GEOMETRIC PATTERN RECOGNITION TECHNIQUES APPLIED TO LAND LANDSAT DIGITAL DATA FOR URANIUM EXPLORATION
1979 291 p refs
(Contract DE-AC13-76GJ-01664)
(GJBX-26(80)) Avail: NTIS HC A13/MF A01
Six training sites were selected, consisting of Copper Mountain (Wyoming), Pumkin Buttes/Kaycee (Wyoming), Grants (New Mexico), Rossing (Namibia), Marysvale (Utah), and Beaverlodge (Saskatchewan). For each of these sites, displays and/or texture measures were generated, and where possible discrimination functions were developed to separate known uraniferous areas from areas of unknown uranium content. Of all data sources and all texture measures, the most successful was the measure pair, inverse difference moment plotted against angular second moment, applied to the third eigenband of the LANDSAT data. This measures pair permitted separation of uranium from non-uranium in certain geologies (particularly Pumpkin Buttes/Kaycee) but was unsuccessful in others. Although the results obtained cannot be described as providing a new tool for uranium exploration, there is clear evidence that computed texture measures are describing some element of the LANDSAT data source that cannot be readily observed or analyzed by human interpreters. SAINT LAWRENCE RIVER ALL-YEAR NAVIGATION ICE CONTROL SYSTEM Final Report
Jack W. Lewis and Robert P. Johnson Apr 1980 145 p refs Sponsored in part by Winter Navigation Season Extension Demonstration Program
(Contract DOT-SL-76-469)
(PB80-183478, SLSDC-281C-3) Avail: NTIS HC A07/MF A01 CSCL 08L
Designs and specifications for an ice control system which would allow all year navigation in the Brockville to Cardinal section of the international portion of the are proposed. A distorted scale (horizontal scale, 1:150; vertical scale, 1:60) hydraulic model of the section of the river extending from Stillwells Point, New York to Red Mills, New York was utilized. Three alternative ice control systems were tested under varying river flow rates and stage and under varying ice conditions which included ice cover formation, consolidated ice covers, and spring breakup. MAPPING MODEL FOR DETERMINING LAND SUITABLE FOR IRRIGATION. Final Report.
Richard O. Hoffman. 28 Apr. 1980. 25 p. refs.
(Contract DI-14-31-0001-5027)
(PB80-188683; W80-05246; OWRT-A-039-NEB-1) Avail: NTIS. HC A02/MF A01. CSCL 08B.

CMS-11, a computer composite mapping system, was adapted for use on the IBM 360, Model 198 computer system at the University of Nebraska for use in developing a Nebraska map showing land that is suitable for the development of irrigation systems. A land use mapping process was used based on viewing each piece of land on two separate color IR aerial photos, one taken in early summer and the other in late summer. Separate computer plots were produced for each of 27 types of land use. The program was also used to develop a mathematical model that predicts the number of acres that will be developed in future years for each soil series. GRA

COMPARISON OF TRACER METHODS AND PREDICTIVE EQUATIONS FOR DETERMINATION OF STREAM-REAERATION COEFFICIENTS ON THREE SMALL STREAMS IN WISCONSIN. Final Report.
R. S. Grant and Steven Skavroneck (Wisconsin Dept. of Natural Resources, Madison). Apr. 1980. 43 p. refs.
(PB80-193642; USGS/WRD/WRI-80/024; USGS/WRI-80-19) Avail: NTIS. HC A03/MF A01. CSCL 08H.

Four modified nonradioactive tracer methods and 20 predictive equations for determination of stream reaeration coefficients (K2) in three small Wisconsin streams were compared with the radioactive tracer method developed by Tsivoglou. Of the four modified tracer techniques, the propane area technique, which measures the total weight of propane gas passing stream sampling stations, yielded the least mean absolute difference of 11.0 percent compared with the radioactive tracer method. The propane peak concentration, ethylene peak concentration, and ethylene total weight methods gave mean absolute differences of 18, 21, and 26 percent, respectively. GRA

IMPROVING THE EFFICIENCY OF SILICON SOLAR CELLS CONTAINING CHROMIUM. Patent Application.
Amal M. Salama, inventor (to NASA) (JPL). Filed 11 Sep. 1980. 16 p.
(Contract NAS7-100)
(NASA-Case-NPO-15179-1; US-Patent-Appl-SN-185867) Avail: NTIS. HC A02/MF A01. CSCL 10A.

Efficiency of silicon solar cells containing about 10 to the 15th power atoms/cu cm of chromium is improved about 26% by thermal annealing of the silicon wafer at a temperature of 200 C to form chromium precipitates having a diameter of less than 1 Angstrom. Further improvement in efficiency is achieved by scribing laser lines onto the back surface of the wafer at a spacing of at least 0.5 mm and at a depth of less than 13 micrometers to preferentially precipitate chromium near the back surface and away from the junction region of the device. This provides an economical way to improve the deleterious effects of chromium, one of the impurities present in metallurgical grade silicon material. NASA

A COMPUTER MODEL OF SOLAR PANEL-PLASMA INTERACTIONS Final Report
David L. Cooke and John W. Freeman [1980] 59 p refs
(Contract NAS9-15796)
(NASA-CR-160796) Avail: NTIS HC A04/MF A01 CSCL 10A

High power solar arrays for satellite power systems are presently being planned with dimensions of kilometers, and with tens of kilovolts distributed over their surface. Such systems face many plasma interaction problems, such as power leakage to the plasma, particle focusing, and anomalous arcing. These effects cannot be adequately modeled without detailed knowledge of the plasma sheath structure and space charge effects. Laboratory studies of 1 by 10 meter solar array in a simulated low Earth orbit plasma are discussed. The plasma screening process is discussed, program theory is outlined, and a series of calibration models is presented. These models are designed to demonstrate that PANEL is capable of accurate self consistant space charge calculations. Such models include PANEL predictions for the Child-Langmuir diode problem. S.F.

HYDROGEN PRODUCTION BY PHOTOELECTROLYTIC DECOMPOSITION OF H2O USING SOLAR ENERGY Final Report, 1 Dec. 1975 - 30 Nov. 1979
R. D. Rauh, S. A. Alkaitis, J. M. Buzby, and R. Schiff Aug. 1980 66 p refs
(Contracts NAS7-100; JPL-955271)
(NASA-CR-163586; JPL-9950-406) Avail: NTIS HC A04/MF A01 CSCL 10A

Photoelectrochemical systems for the efficient decomposition of water are discussed. Semiconducting d band oxides which would yield the combination of stability, low electron affinity, and moderate band gap essential for an efficient photoanode are sought. The materials PdO and Fe-xRhxO3 appear most likely. Oxygen evolution yields may also be improved by mediation of high energy oxidizing agents, such as CO3(-). Examination of several p type semiconductors as photocathodes revealed remarkable stability for p-GaAs, and also indicated p-CdTe as a stable H2 photoelectrode. Several potentially economical schemes for photoelectrochemical decomposition of water were examined, including photoelectrochemical diodes and two stage, four photon processes. S.F.

STUDY PROGRAM FOR ENCAPSULATION MATERIALS INTERFACE FOR LOW COST SILICON SOLAR ARRAY Annual Report, 1 Jan. - 31 Dec. 1979
D. H. Kaelble, F. B. Mansfeld, J. B. Lunsden, III, and C. Leung Mar. 1980 88 p refs
(Contracts JPL-954739; N00014-75-C-0788; NR Proj. 036-108)
(NASA-CR-163583; DOE/JPL-954739-3; SC5106.86AR; JPL-9950-416; AR-1) Avail: NTIS HC A05/MF A01 CSCL 10A

An atmospheric corrosion model was developed and verified by five months of corrosion rate and climatology data acquired at the Mead, Nebraska LSA test site. Atmospheric corrosion rate monitors (ACM) show that moisture condensation probability and ionic conduction at the corroding surface or interface are controlling factors in corrosion rate. Protection of the corroding surface by encapsulant was shown by the ACM recordings to be maintained, independent of climatology, over the five months outdoor exposure period. The macroscopic corrosion processes which occur at Mead are shown to be reproduced in the climatology simulator. Controlled experiments with identical moisture and temperature aging cycles show that UV radiation causes corrosion while UV shielding inhibits LSA corrosion. R.K.G.

LARGE WIND TURBINES: A UTILITY OPTION FOR THE GENERATION OF ELECTRICITY
W. H. Robbins, R. L. Thomas, and D. H. Baldwin 1980 18 p refs Presented at the Am. Power Conf., Chicago, 21-23 Apr. 1980; sponsored by Illinois Inst. of Tech.; presented at the Ann. Solar Energy Program Rev., Rockport, Maine, 26-28 Aug. 1980.

sponsored by Electric Power Research Inst.
(Contract DE-AI01-79ET-23139)
(NASA-TM-81502; DOE/NASA/23139-1; E-440) Avail: NTIS HC A02/MF A01 CSCL 10B

The wind resource is such that wind energy generation has the potential to save 6-7 quads of energy nationally. Thus, the Federal Government is sponsoring and encouraging the development of cost effective and reliable wind turbines. One element of the Federal Wind Energy Programs, Large Horizontal Axis Wind Turbine Development, is managed by the NASA Lewis Research Center for the Department of Energy. There are several ongoing wind system development projects oriented primarily toward utility application within this program element. In addition, a comprehensive technology program supporting the wind turbine development projects is being conducted. An overview is presented of the NASA activities with emphasis on application of large wind turbines for generation of electricity by utility systems. Author

SATELLITE POWER SYSTEM (SPS) CONCEPT DEFINITION STUDY. VOLUME 3: EXPERIMENTAL VERIFICATION DEFINITION Final Contractor Report
G. M. Hanley. Sep. 1980. 145 p.
(Contract NAS8-32475)
(NASA-CR-3320; SSD-79-0010-3) Avail: NTIS HC A07/MF A01 CSCL 10A

An evolutionary Satellite Power Systems development plan was prepared. Planning analysis was directed toward the evolution of a scenario that met the stated objectives, was technically possible and economically attractive, and took into account constraining considerations, such as requirements for very large scale end-to-end demonstration in a compressed time frame, the relative cost/technical merits of ground testing versus space testing, and the need for large mass flow capability to low Earth orbit and geosynchronous orbit at reasonable cost per pound. T.M.

N80-32861*# Rockwell International Corp., Downey, Calif.
SATELLITE POWER SYSTEMS (SPS) CONCEPT DEFINITION STUDY. VOLUME 5: SPECIAL EMPHASIS STUDIES Final Report
G. M. Hanley. Sep. 1980. 265 p. refs.
(Contract NAS8-32475)
(NASA-CR-3322; SSD-79-0010-5) Avail: NTIS HC A12/MF A01 CSCL 10A

Satellite configurations based on the Satellite Power System baseline requirements were analyzed and a preferred concept selected. A satellite construction base was defined, precursor operations incident to establishment of orbital support facilities identified, and the satellite construction sequence and procedures developed. Rectenna construction requirement were also addressed. Mass flow to orbit requirements were revised and traffic models established based on consutrcution of 60 instead of 120 satellites. Analyses were conducted to determine satellite control, resources, manufacturing, and propellant requirements. The impact of the laser beam used for space-to-Earth power transmission upon the intervening atmosphere was examined as well as the inverse effect. The significant space environments and their effects on spacecraft components were investigated to define the design and operational limits imposed by the environments on an orbit transfer vehicle. The results show that LEO altitude < 300 nmi and transfer orbit duration < 6 months are preferrable. J.M.S.

ENERGY STORAGE AS HEAT-OF-FUSION IN CONTAINERIZED SALTS. REPORT ON ENERGY STORAGE BOILER TANK Interim Report
T. A. Chubb, J. J. Nemecek, and D. E. Simmons. 27 Jun. 1980. 110 p. refs.
(Contract EC-77-A-31-1024; RR0240145)
(AD-A087753; AD-E000495; NRL-MR-4267) Avail: NTIS HC A06/MF A01 CSCL 10/3

This report is concerned with energy storage based on heat-of-fusion in containerized salt. The 'energy storage boiler tank' uses evaporation and condensation of a heat transfer fluid to provide heat transfer into and out of stacked cans of salt. The 'energy storage superheater tank' uses a network of alkali metal heat pipes to distribute heat throughout a building filled with salt cans. It uses a radiation to transfer energy to and from stacked cans of salt. The paper summarizes the rationale for energy storage in containerized salt, it discusses salt availability, salt processing, container requirements, can technology and heat transfer fluid degradation problems. These discussions lead to estimates of energy storage system costs. The Naval Research Laboratory is building a 2 MWht proof-of-concept energy storage boiler tank. Laboratory investigations studying the compatibility of the heat transfer fluid with the molten storage salt are described, along with measurements of temperature drops associated with the energy input process. An assessment of the current status of the energy storage boiler tank is presented. GRA

USE OF SOLAR ENERGY TO PRODUCE PROCESS HEAT FOR INDUSTRY
Ken Brown. Apr. 1980. 28 p. refs. Presented at the 30th Ann. Plant Eng. and Maintenance Conf., Chicago, 24 Mar. 1980.
(Contract EG-77-C-01-4042)
(SERI/TP-731-626; CONF-800373-1) Avail: NTIS HC A03/MF A01

The role of solar energy in supplying heat and hot water to residential and commerical buildings is familiar. On the other hand, the role that solar energy may play in displacing imported energy supplies in the industrial and utility sectors often goes unrecognized. The versatility of solar technology lends itself well to applications in industry; particulary to the supplemental supply for process heat. The status of solar thermal technology for industrial process heat applications, including a description of current costs and operating histories is surveyed. The most important objectives to be met in improving system performance, reducing cost, and identifying markets for solar industrial process heat are outlined. DOE

OPEN-CYCLE MHD POWER CONDITIONING AND CONTROL REQUIREMENTS DEFINITION Final Report
S. Petty and K. Williams. Mar. 1980. 70 p. refs.
(EPRI-AP-1345) Avail: NTIS HC A04/MF A01

A generic inverter configuration is defined, and the relevant characteristics of line and forced commutated inverters are compared and evaluated for their suitability for magnetohydrodynamic (MHD) power application. The interface requirements of an MHD channel inverter utility interactive system are defined, and a forced commutated inverter meeting these requirements is described. The results of a set of tests using this inverter are described along with recommendations for future work in this field. DOE

N80-32865# SRI International Corp., Menlo Park, Calif.
DIRECT ELECTROCHEMICAL GENERATION OF ELECTRICITY FROM COAL Progress Report, 16 May 1977 - 15 Feb. 1979
Robert D. Weaver, Steven C. Leach, Arthur E. Bayce, and Leonard Nanis. 1979. 151 p. refs.

(Contract EY-76-C-03-0115)
(SAN-0115/105-1) Avail: NTIS HC A08/MF A01

The feasibility of the coal air fuel cell was investigated. Results of fabrication of anodes from coal, the factors influencing cell design and voltage current behavior of the carbon anode, and results of materials selection for the air cathode are among the topics discussed. The overall thermal efficiency of a nonoptimized plant is calculated and presented. The results indicate a nonpolluting process equivalent to or exceeding present day thermal efficiencies. Conservative analysis for a plant with carbon pellet anode feed and bottoming thermal recovery indicates an overall efficiency of 53.3% and a cost of $758 per kilowatt (638 MW plant, 1978 dollars). This cost is below competing molten carbonate systems using gaseous anode feed. DOE

N80-32866# Braun (C. F.) and Co., Alhambra, Calif.
ASSESSMENT OF SULFUR REMOVAL PROCESSES FOR ADVANCED FUEL CELL SYSTEMS Final Report
G. A. Lorton. Jan. 1980. 156 p. refs. Sponsored by Electric Power Research Inst.
(EPRI-EM-1333) Avail: NTIS HC A08/MF A01

The performance characteristics of potential sulfur removal processes were evaluated and four of these processes, the Selexol process, the Benfield process, the Sulfinol process, and the Rectisol process, were selected for detailed technical and economic comparison. The process designs were based on a consistent set of technical criteria for a grass roots facility with a capacity of 10,000 tons per day of Illinois No. 6 coal. Two raw gas compositions, based on oxygen blown and air blown Texaco gasification, were used. The bulk of the sulfur was removed in the sulfur removal unit, leaving a small amount of sulfur compounds in the gas. The remaining sulfur compounds were removed by reaction with zinc oxide in the sulfur polishing unit. The impact of COS hydrolysis pretreatment on sulfur removal was evaluated. Comprehensive capital and O and M cost estimates for each of the process schemes were developed. DOE

(Contracts ET-78-C-03-2051; DE-AC03-78ET-21050)
(DOE-ET-21050/1-1) Avail: NTIS HC A06/MF A01

The major effort of the project was development and assessment of a commercial scale power plant concept where both solar energy and fossil fuel are used to generate electricity. This so called hybrid concept was developed around a combined cycle gas turbine/steam turbine power plant. A market analysis, and parametric and system studies were included leading to a comparative evaluation of the Modified Strawman and Advanced Strawman systems. DOE

COMBINED CYCLE SOLAR CENTRAL RECEIVER HYBRID POWER SYSTEM STUDY. VOLUME 2 Final Technical Report
Nov. 1979. 491 p. refs.
(Contracts ET-78-C-03-2051; DE-AC03-78ET-21050)
(DOE-ET-21050-1-2) Avail: NTIS HC A21/MF A01

The conceptual design for a commercial scale (nominal 100-MWe) central receiver solar/fossil fuel hybrid power system with combined cycle energy conversion was developed. A near term, metallic heat pipe receiver and an advanced ceramic tube receiver hybrid system are defined through parametric and market potential analyses. Energy storage is not required and analyses show no economic advantages with energy storage provisions. It is concluded that the near term solar hybrid system is a cost effective alternative to conventional gas turbines and combined cycle generating plants, and has potential for intermediate load market penetration at 15% annual fuel escalation rate. Due to their flexibility, simple solar/nonsolar interfacing, and short startup cycles, these hybrid plants have significant operating advantages. Utility company comments suggest that hybrid power systems will precede stand-alone solar plants. DOE

DOCUMENTATION OF VOLUME 3 OF THE 1978 ENERGY INFORMATION ADMINISTRATION ANNUAL REPORT TO CONGRESS Annual Report
29 Feb. 1980. 325 p. refs.
(Contract DE-AC01-79EI-10456)
(DOE/EIA-CR-0456) Avail: NTIS HC A14/MF A01

In a preliminary overview of the projection process, the relationship between energy prices, supply, and demand is addressed. Topics treated in detail include a description of energy economic interactions, assumptions regarding world oil prices, and energy modeling in the long term beyond 1995. Subsequent sections present the general approach and methodology underlying the forecasts, and define and describe the alternative projection series and their associated assumptions. Short term forecasting, midterm forecasting, long term forecasting of petroleum, coal, and gas supplies are included. The role of nuclear power as an energy source is also discussed. DOE

PHOTOVOLTAIC APPLICATIONS DEFINITION AND PHOTOVOLTAIC SYSTEM DEFINITION STUDY IN THE AGRICULTURAL SECTOR. VOLUME 2: TECHNICAL RESULTS
R. W. Mengel, T. P. Nadolski, D. C. Sparks, S. K. Young, and A. Yingst. May 1980. 230 p. Prepared for Sandia Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(SAND-79-7018/2-Vol-2) Avail: NTIS HC A11/MF A01

This volume describes the technical results of the study of potential photovoltaic (P/V) applications in US agriculture. The results presented address all technical aspects of the program and include a summary of agricultural energy consumption. The objectives of the technical effort reported were to: (1) identify and characterize agricultural energy demands that can effectively use P/V power systems; (2) develop effective P/V system designs for the four most promising applications; (3) determine performance and cost estimates for the designs; and (4) recommend systems for early test and demonstration and critical issues requiring further systems studies. The farms chosen for conceptual design include: (1) poultry layer farm, (2) hog production farm, (3) beef feedlot, and (4) year round vegetable farm. DOE

COMPARISON OF SOLAR-THERMAL AND FOSSIL TOTAL-ENERGY SYSTEMS FOR SELECTED INDUSTRIAL APPLICATIONS
Gerald D. Pine. Jun. 1980. 75 p. refs.
(Contract W-7405-eng-26)
(ORNL/TM-7022) Avail: NTIS HC A04/MF A01

Economic analyses of a conventional system and total energy systems based on phosphoric acid fuel cells, diesel piston engines, and central receiver solar thermal systems were performed for each of four industrial applications: a concrete block plant in Arizona, a fluid milk processing plant in California, a sugar beet processing plant in Colorado, and a meat packing plant in Texas. A series of sensitivity analyses was performed to show the effects of variations in fuel price, system size, cost of capital, and system initial cost. Solar total energy systems (STES) are more capital intensive than the other systems, and significant economies of scale are associated with the STES. If DOE solar system cost goals are met, STES can compete with the other systems for facilities with electrical demands greater than two or three megawatts, but STES are not competitive for smaller facilities. Significant energy resource savings, especially of oil and gas, resulted from STES implementation in the four industries. DOE

POROUS MEDIA EXPERIENCE APPLICABLE TO FIELD EVALUATION FOR COMPRESSED AIR ENERGY STORAGE
R. D. Allen and P. J. Gutknecht. Jun. 1980. 98 p. refs.
(Contract DE-AC06-76RL-01830)
(PNL-3294) Avail: NTIS. HC A05/MF A01

A survey is presented of porous media field experience that may aid in the development of a compressed air energy storage field demonstration. Related experience embraces technologies of natural gas, thermal energy, and geothermal and hydrogen storage. Natural gas storage technology lends the most toward compressed air storage development, keeping in mind the respective differences between stored fluids, physical conditions, and cycling frequencies. Both fluids are injected under pressure into an aquifer to form a storage bubble confined between a suitable caprock structure and partially displaced ground water. State-of-the-art information is summarized as the necessary foundation material for field planning. Suggested ranges are given for injection air temperature and reservoir pressure. DOE

RESIDENTIAL PHOTOVOLTAIC FLYWHEEL STORAGE SYSTEM PERFORMANCE AND COST
R. D. Hay, A. R. Millner, and P. O. Jarvinen. 1980. 6 p. refs.
Presented at the 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 18-22 Aug. 1980
(Contract DE-AC02-76ET-20279)
(DOE/ET-20279/92; CONF-800806-22) Avail: NTIS. HC A02/MF A01

A subscale prototype of a flywheel energy storage and conversion system for use with photovoltaic power systems of residential and intermediate load-center size was designed, built and tested. System design, including details of such key components as magnetic bearings, motor generator, and power-conditioning electronics, are described. Performance results of prototype testing are given and indicate that this system is the equal of or superior to battery and inverter systems for the same application. Results of cost and user-worth analysis show that residential systems are economically feasible in stand-alone and in utility-interactive applications. DOE

PHOTOELECTRONIC PROPERTIES OF ZINC PHOSPHIDE CRYSTALS, FILMS AND HETEROJUNCTIONS. Quarterly Progress Report, 1 Jul. - 30 Sep. 1979
Richard H. Bube. Oct. 1979. 25 p. refs. Prepared in cooperation With Midwest Research Inst., Golden, Colo.
(Contract EG-77-C-01-4042)
(SU-DSE-4042-T12; QPR-2) Avail: NTIS. HC A02/MF A01

The closed tube horizontal growth method was pursued for the growth of single crystals of Zn3P2. The rate of material transport was increased by increasing the temperature difference between source and growth regions and by decreasing the distance involved. A boule with only 2 grains in a 12 mm diameter was obtained. Only small photoresponse was obtained with these totally experimental cells. The Zn3P2 films deposited on glass by CSVT were shown to be amorphous whereas those deposited on single crystal CdS were polycrystalline. Laser anealing was shown to have dramatic effects in crystallizing Zn3P2 films deposited on Si3N4 film substrates on single crystal Si. Thin films of Zn3P2 were deposited on glass substrates by vacuum evaporation. Optical transmission and reflection spectra, as well as photoconductivity spectral response were measured on a number of these films. DOE

PHOTOELECTRONIC PROPERTIES OF ZINC PHOSPHIDE CRYSTALS, FILMS AND HETEROJUNCTIONS. Quarterly Progress Report, 26 Feb. - 30 Jun. 1979
Richard H. Bube. Jul. 1979. 10 p. refs. Prepared in cooperation with Midwest Research Inst., Golden, Colo.
(Contract EG-77-C-01-4042)
(SU-DSE-4042-T10; QPR-1) Avail: NTIS. HC A02/MF A01

A closed tube method was developed for the synthesis of Zn3P2 from the elements which eliminates the potential dangers associated with high P pressures. Subsequent materials synthesis will be done routinely by this method. Initial efforts at single crystal growth of Zn3P2 from this material yielded polycrystalline material because of nucleation along the walls of the tube. Techniques for improving the situation are being tested. Progress is reported on the development of a CVD apparatus for the deposition of wide bandgap oxides and sulfides on a variety of substrates including Zn3P2. Layer deposition by the close spaced vapor transport method to be applied to Zn3P2 was successfully tested using CdTe on both quartz and CdS substrates. DOE

ADVANCED TECHNOLOGY FUEL CELL PROGRAM. Annual Report
J. A. S. Bett, C. L. Bushnell, R. F. Buswell, G. A. Gruver, J. M. King, and H. R. Kuna. 1980. 116 p. refs.
(EPRI-EM-1328) Avail: NTIS. HC A06/MF A01

Efforts were undertaken to establish a basis for the engineering development of an improved fuel cell power plant. These focused on molten carbonate fuel cells, advanced reformers, and use of coal products. Molten carbonate cell configurations were developed that are capable of enduring thermal cycles and were demonstrated in square foot stacks of 8 and 20 cells. Subscale cells were tested at pressures of up to 5 atmospheres with little, if any, carbon or methane formation in the fuel cell. In addition, an adiabatic, a hybrid, and a cyclic reformer were evaluated. DOE

THERMAL ENERGY STORAGE FOR BUILDING HEATING AND COOLING APPLICATIONS. Technical Progress Report, Apr. 1979 - Mar. 1980
J. F. Martin and H. W. Hoffman. Jun. 1980. 65 p. refs.
(Contract W-7405-eng-26)
(ORNL-TM-7319) Avail: NTIS. HC A04/MF A01

The ORNL program in thermal energy storage (TES) over the past year is reported. The program consists of developing sensible and latent heat technologies to meet the single goal of reduction in oil and gas consumption for residential and space conditioning. Three specific application elements were addressed: utility load management, solar energy applications; and conservation. Programs (both completed and ongoing) are summarized, and their relationship to the specific implementation plan are given. The program completed a transition from low temperature storage development including seasonal storage in natural aquifers to TES development for building heating and cooling applications. DOE

ANNUAL CYCLE ENERGY SYSTEM (ACES). Performance Report, Nov. 1977 - Sep. 1978
A. S. Holman and L. A. Abbatiello. May 1980. 77 p. refs.
(Contract W-7405-eng-26)
(ORNL/CON-42) Avail: NTIS. HC A05/MF A01

A single family residence near Knoxville, Tennessee, is being used to demonstrate the energy conserving features of the annual cycle energy system (ACES), an integrated heating and cooling system that utilizes a unidirectional heat pump and low temperature thermal storage. A second house, the control house, is being used to compare the performance of the ACES with that

of an electric resistance heating and hot water system combined with a central air conditioning system. The ACES reduced peak utility system demands significantly, a reduction from 11.7 to 3.1 kW was achieved in the winter and from 4.1 to 0.7 kW in the summer. The only problems encountered were a heat leak into the storage bin that was twice the calculated value and control logic errors that produced excessive hot water in the winter, requiring extensive use of the night heat rejection mode in the summer. These problems are currently being corrected.

OPEN-CYCLE MHD SYSTEMS ANALYSIS Final Report
T. E. Lippert and K. D. Weeks. Feb. 1980. 511 p. refs.
(EPRI Proj. 640-1)
(EPRI-AP-1316) Avail: NTIS. HC A22/MF A01

Five variant configurations of a coal burning open cycle magnetohydrodynamic electric power generating facility were studied for evaluation as candidate first generation power plants. A material and energy balance and cycle analysis was performed for each case to provide information for the conceptual designs and costing of all major MHD related components and subsystems as well as specification of other state of the art components. A economic comparison was made of each design by developing the cost of electricity based on component costs, estimates of operation and maintenance requirements, and the performance of each plant from the system analyses. An overall description of each plant is provided along with discussions of critical component and process development. An oxygen enriched OCMHD plant design was identified as an attractive candidate for first generation utility service. This plant design appears to offer competitive costs of electricity and minimizes development risk.

DEVELOPMENT OF CELLULOSE FLYWHEEL ROTORS Final Report
Arthur G. Erdman, David L. Hagen, and Darrell A. Frohrib. Mar. 1980. 105 p. refs. Prepared for Sandia Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(SAND-79-7099) Avail: NTIS. HC A06/MF A01

The primary tasks addressed were the design and development of durable hub-to-rotor attachments and the balancing and vibrational analysis of the resulting hub rotor systems, and measuring and analyzing the strength distributions and durabilities of different types of plywood and of hub rotor systems. In accomplishing these tasks, a metallic hub to cellulose rotor bonding attachment was designed which utilizes a flexible scalloped metal band in lieu of the traditional elastomeric layers to accommodate the differential strain between rotor and hub. A self centering dynamic balancer was designed to automatically locate the inertial axis of a rotor. In analyzing rotor vibrations, a nondimensional design parameter was derived which correlates the support flexibility required to the usable strength and length of the rotor for a useful operating range above the transverse critical frequency.

REFERENCE ENERGY SYSTEMS AS APPLIED TO REGIONAL ENERGY POLICY
A. Hermelee. Dec. 1979. 26 p. refs.
(Contract EY-76-C-02-0016)
(BNL-26987) Avail: NTIS. HC A03/MF A01

Reference Energy Systems (RES) was developed for the region serviced by the Tennessee Valley Authority for a base time period and projections developed for the years 1985 and 2000. The RES is a network representation of the technical activities required to supply various forms of energy to end-use activities. Technologies are defined for all operations involving specific fuels including resource extraction, refinement, conversion, transportation, distribution, and utilization. The impact of a new technology in terms of resource consumption may be evaluated by modifying the energy flow paths in a region to incorporate the new technology. Alternate paths through the network reflect the substitutability of resources and technologies for one another.

ANALYSIS OF A PASSIVE HEAT PIPE COOLED SOLAR PHOTOVOLTAIC RECEIVER
K. T. Feldman, Jr. and D. D. Kenney. May 1980. 97 p. refs. Prepared in cooperation with Energy Engineering, Inc., Albuquerque, N. Mex. Prepared for Sandia Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(SAND-80-7011) Avail: NTIS. HC A05/MF A01

A design study to analyze the performance of an aluminum heat pipe for passive cooling of photovoltaic cells is presented. The heat pipe vessel is an aluminum extrusion with a wedge shaped cross section. The solar cells are mounted on the lower surface where they are irradiated by a parabolic trough solar concentrator. The maximum solar cell temperature is 140 C. Heat is removed from the condenser surface by convection to the ambient air at 40 C. Working fluid selection, heat pipe analysis, and method of performance calculations are described.
DOE

SILICON CONCENTRATOR SOLAR CELL MANUFACTURING DEVELOPMENT
L. Grenon. May 1980. 174 p. Prepared for Sandia Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(SAND-80-7018) Avail: NTIS. HC A08/MF A01

A manufacturing development program was conducted in which silicon concentrator solar cells designed to operate at 50 suns were produced. The purpose of this program was to determine the various design requirements for the cell at concentration, develop the manufacturing processes necessary to fabricate the solar cell, and fabricate a total of 2000 solar cells of two separate geometries. A technical analysis was performed to determine those parameters that affect the performance of a silicon concentrator solar cell. For the purposes of this contract, this analysis was limited to solar concentrations up to 50 suns. Included in the analysis are examinations of the base and emitter regions, surface effects, spectral response, and specific design criteria for both type 1 and type 2 concentrator solar cells. Based on the design requirements, a manufacturable process was developed and cells were fabricated.

CHEMICAL ENERGY STORAGE FOR SOLAR THERMAL CONVERSION Final Report
Richard D. Smith, D. R. Poole, C. H. Li, D. K. Carlson, and D. R. Peterson. 27 Apr. 1979. 99 p. refs
(Contract DE-AC04-76DP-00789)
(SAND-79-8198; RRC-80-R-678) Avail: NTIS HC A05/MF A01

The technical and economic aspects of using reversible chemical reactions to store energy in Solar Thermal Electric Conversion (STEC) facilities were studied. The study included identification of nine promising chemical reactions from a list of over 550 candidates, preliminary process designs of energy storage subsystems based on these nine reactions, and extensive systems studies of autonomous and hybrid STEC plants with energy storage subsystems based on the reversible oxidation of SO_2. The systems studies used a detailed simulation, based on a year long, hour by hour energy balance, of a central receiver STEC facility. Over a range of alternate energy cost and geographic location, the optimum busbar energy costs from autonomous STEC plants were 15 to 90% higher than those from hybrid plants. Optimum storage requirements of autonomous STEC plants were in the range of 200 to 400 hours, while those for hybrid plants were in the range of 15 to 30 hours. DOE

N80-32890# ARCO Solar, Inc., Chatsworth, Calif.
DESIGN AND FABRICATION OF COMBINED PHOTOVOLTAIC-THERMAL COLLECTORS
May 1980. 54 p.
(Contract DE-AC04-76DP-00789)
(SAND-79-7008) Avail: NTIS HC A04/MF A01

Two water-cooled and two air-cooled modules were designed, fabricated, and tested. Module designs were developed which effectively combined photovoltaic cell and module technology with solar thermal module technology, with minimum modification. The combined modules were designed to be mechanically interchangeable with production solar thermal modules. This design approach was selected to minimize installation and reliability problems, and to reduce costs of combined modules by minimizing new tooling requirements. Both the electrical and thermal performance of the experimental modules was lower than calculated during the design phase of the program, and lower than required by the Sandia specification. DOE

N80-32891# BDM Corp., McLean, Va.
PHOTOVOLTAIC APPLICATIONS DEFINITION AND PHOTOVOLTAIC SYSTEM DEFINITION STUDY IN THE AGRICULTURAL SECTOR. VOLUME 3. APPENDIXES Final Report
R. W. Mengel, T. P. Nadolski, D. C. Sparks, S. K. Young, and A. Yingst. May 1980. 221 p. refs

SOLAR POWERED RANKINE CYCLE IRRIGATION PUMP Final Report
William D. Batton and Robert E. Barber. Sep. 1979. 87 p. refs
(Contract DE-AC03-78ET-20419)
(DOE/ET-20419/1; SAN-0419-1) Avail: NTIS HC A05/MF A01

Results of a test program where a small (288 square feet) collector field was installed and used for boiling-in-the-collector tests with R-113 as a working fluid are presented. Two different types of parabolic trough tracking collectors were purchased and tested. There were two rows (128 sq ft) of Del Manufacturing collectors and one row (160 sq ft) of Solar Kinetics collectors. All three rows were installed at a 5 degree angle (inclined to the South) oriented North-South and tracking East-West on the roof at Barber-Nichols in Arvada, Colorado. These two types of collectors have distinct differences that made it worthwhile to test each type. A Rankine engine, less turbine expander, was installed and used to complete a solar power system. The major experimental results are that the collectors did heat the R-113, did provide a vapor suitable for turbine feed, and stable flow did occur under all conditions, thus proving the feasibility of the boiling-in-collector concept. DOE

(Contract ET-78-C-03-2051)
(DOE/ET-21050/1-3-Vol-3) Avail: NTIS HC A09/MF A01

A design study for a 100 MW gas turbine/steam turbine combined cycle solar/fossil fuel hybrid power plant is presented. The appendices contain: (1) preconceptual design data; (2) market potential analysis methodology; (3) parametric analysis methodology; (4) EPGS system description; (5) commercial-scale solar hybrid power system assessment; and (6) conceptual design data lists. DOE

N80-32894# Sandia Labs., Albuquerque, N. Mex. Solar Energy Projects Dept.
FLUID TEMPERATURE CONTROL FOR PARABOLIC TROUGH SOLAR COLLECTORS
Rudolph Schindwoff. 1980. 27 p. refs. Presented at the Joint Autom. Control Conf., San Francisco, 13 Aug. 1980
(Contract DE-AC04-76DP-00789)
(SAND-79-2006C; CONF-800805-2) Avail: NTIS HC A03/MF A01

Techniques for controlling the temperature of the heat transfer fluid in parabolic trough solar collectors fields were studied by computer simulation. In particular, the rather stringent temperature control requirements associated with thermal electric power generation or cogeneration systems are addressed. Computer models representing the fluid temperature dynamics of the collectors and interconnecting piping were developed and integrated with dynamic models of control elements to obtain a closed loop control system simulation. A specific control configuration was chosen consisting of a flow control valve and one or more temperature sensors to control the flow in each row of collectors. Various control algorithms were evaluated for stability and static errors, and time responses to startup transients and to partial and full collector cloud shadowing transients were obtained. The results indicated that the temperature control requirements can be satisfied using readily available components. DOE

PARABOLIC TROUGH SOLAR COLLECTOR WIND LOADING

Duane E. Randall, Donald D. McBride, and Roger E. Tate. 1980. 54 p. refs. Presented at the ASME Century 2 Emerging Technol. Conf., San Francisco, 18-20 Aug. 1980.
(Contract DE-AC04-76DP-00789)
(SAND-79-2134C; CONF-800804-16) Avail: NTIS HC A04/MF A01

Two wind tunnel force and moment tests conducted on parabolic trough solar collector configurations are discussed. The two tests were conducted in different flow field environments, one a uniform flow infinite airstream, the second a simulated atmospheric boundary layer flow with the models simulating a ground mounted installation. The force and moment characteristics of both isolated single module troughs and of trough modules within array configurations were defined over both operational and stow attitudes. The influence of various geometric design parameters for collector modules and arrays was established. Data indicate that forces and moments increase with mounting height and with trough aspect ratio. Collector modules interior to large arrays experience wind force reductions as high as 50 to 65%, while appropriate fences or berms surrounding the arrays can provide exterior modules with protection of this order. DOE

N80-32896# Chicago Univ., Ill.

FUNDAMENTALS AND TECHNIQUES OF NONIMAGING OPTICS FOR SOLAR ENERGY CONCENTRATION. Final Report

Roland Winston and Joseph J. Gallagher. 20 May 1980. 51 p. refs.
(Contract DE-AS02-78ER-04657)
(DOE/ER-04657/2) Avail: NTIS HC A04/MF A01

The properties of a variety of new and previously known nonimaging optical configurations were investigated. A thermodynamic model which explains quantitatively the enhancement of effective absorptance of gray body receivers through cavity effects was developed. The classic method of Liu and Jordan, which allows one to predict the diffuse sunlight levels through correlation with the total and direct fraction was revised and updated and applied to predict the performance of nonimaging solar collectors. The conceptual design for an optimized solar coolector which integrates the techniques of nonimaging concentration with evacuated tube collector technology was carried out and is presently the basis for a separately funded hardware development project. DOE

LOW-COST FLYWHEEL DEMONSTRATION PROGRAM. Final Report, 1 Oct. 1977 - 31 Dec. 1979

D. W. Rabenhorst, T. R. Small, and W. O. Wilkinson. Apr. 1980. 109 p. refs.
(Contract DE-AC01-77ET-26931)
(DOE/ET-26931/T1; SDO-5540) Avail: NTIS HC A06/MF A01

The Applied Physics Laboratory/Department of Energy Low Cost Flywheel Demonstration Program was initiated and all primary objectives were successfully achieved as follows: demonstration of a full-size, 1 kWh flywhel having an estimated cost in large volume production of approximately $50/kWh; development of a ball bearing system having losses comparable to the losses in a totally magnetic suspension system; and successful and repeated demonstration of the low cost flywheel in a complete flywheel energy storage system based on the use of ordinary house voltage and frequency. Application of the experience gained in the hardware program to project the system design into a complete, full scale, 30 kWh home type flywheel energy storage system was also completed. DOE

RESEARCH AND DEVELOPMENT FOR INERTIAL ENERGY STORAGE BASED ON A FLEXIBLE FLYWHEEL. Final Report

John M. Vance. Jun. 1980. 50 p. refs. Prepared for Sandia Labs., Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(SAND-79-7097) Avail: NTIS HC A03/MF A01

A design concept for a nonrigid energy storage flywheel suitable for home or farm use was investigated. The distinguishing feature of this flexible flywheel is its construction from high strength fibers (such as synthetic rope) with no bonding agent. The flexible flywheel is self balancing safe, has a high energy density capability (60 Wh/lb), and should be simple and economical to manufacture. A gimbal support system which stabilizes the flywheel without the need for a squeeze film damper was designed, analyzed, and tested. The conceptual design was developed for a flexible flywheel energy storage system suitable for interfacing with a small scale solar energy source. Cost estimates were prepared for the system in the 10 KWh and 50 KWh sizes. DOE

SEASONAL THERMAL ENERGY STORAGE. Program Progress Report, Apr. - Dec. 1979

J. E. Minor. Mar. 1980. 59 p. Prepared in cooperation with Tennessee Valley Authority, Chattanooga; Texas A and M Univ., College Station; Washington State Univ., Pullman; Auburn Univ., Ala.; California Univ., Lawrence Berkeley Lab.; ORNL, Tenn.; Terra Tek, Inc., Salt Lake City.
(Contract DE-AC06-70RL-01830)
(PNL-3322) Avail: NTIS HC A04/MF A01

The Seasonal Thermal Energy Storage (STES) Program demonstrates the economic storage and retrieval of thermal energy on a seasonal basis, using heat or cold available from waste or other sources during a surplus period to reduce peak period demand, reduce electric utilities peaking problems, and contribute to the establishment of favorable economics for district heating and cooling systems for commercialization of the technology. The STES Program utilizes ground water systems (aquifers) for thermal energy storage. The STES Program is divided into an Aquifer Thermal Energy Storage (ATES) Demonstration Task for demonstrating the commercialization potential of aquifer thermal energy storage technology using an integrated system approach to multiple demonstration projects and a parallel Technical Support Task designed to provide support to the overall STES Program, and to reduce technological and institutional barriers to the development of energy storage systems prior to significant investment in demonstration or commercial facilities. COSTING METHODOLOGIES FOR ENERGY SYSTEMS

Jack Allentuck, Vinod Mubayi, and Ann W. Reisman. Nov. 1979. 23 p. refs. Presented at Conf. on Long-Term Energy Resources, Montreal, 3 Dec. 1979.
(Contract DE-AC02-76CH-00016)
(BNL-27603; CONF-791216-3) Avail: NTIS HC A02/MF A01

The problem of devising a methodology for arriving at costs of systems which may be used to compare alternative sources was addressed. The basic elements of such a methodology were examined. Diverse subjects such as resource supply curves, experience and learning, and the cost of environmental pollution were investigated. DOE

N80-32901# Brookhaven National Lab., Upton, N. Y. National Center for Analysis of Energy Systems.

SIMULATION MODEL FOR ASSESSING BUILDING ENERGY-CONSERVATION POLICIES

Peter T. Kleeman. May 1980. 13 p. refs. Presented at 11th Ann. Conf. on Modeling and Simulation, Pittsburgh, 1-2 May, 1980.
(Contract DE-AC02-76CH-00016)
(BNL-27802; CONF-800549-2) Avail: NTIS HC A02/MF A01

A multiple-region simulation model for estimating economic, environmental, and energy-related impacts of building energy-conservation policies is presented. The model is formulated as a time-stepped sequence of optimization subproblems, each reflecting building energy-conservation options and energy costs, and identifying optimal investments and energy consumption for the time step. DOE

OPERATOR MANUAL: HIGH TEMPERATURE HEAT PUMP
David F. Dyer, Glennon Maples, Thomas E. Burch, and Paul D. Chancellor. 4 Mar. 1980. 66 p.
(Contract DE-AC01-79CS-40163)
(DOE/CS-40163/T1) Avail: NTIS HC A04/MF A01

Experimental data were obtained from operating a high temperature heat pump system. The use of methanol as a working fluid necessitated careful monitoring of refrigerant temperatures and pressures with chemical analysis performed on the working fluid during scheduled down time. Materials sent to vendors and quotes received concerning equipment (compressor, evaporator, condensor, air heater, dryer, two accumulator tanks, and three expansion valves) are discussed. The detailed design and pricing estimates are included. Additional information on layout and construction; start-up; testing; shut down; scheduled maintenance and inspection; safety precautions; control system; and trouble shooting is presented. DOE

N80-32903# Lockheed Missiles and Space Co., Palo Alto, Calif.
ROLE OF MICROCOMPUTERS IN SECONDARY BATTERY DEVELOPMENT AND TESTING
Roger P. Hollandsworth and George B. Adams. 11 Dec. 1979. 138 p. refs.
(Contract W-7405-eng-48)
(UCRL-15171; LMSC-D681058) Avail: NTIS HC A07/MF A01

A low cost dedicated microcomputer system to secondary battery development and testing was developed. An overview of computers, hardware, and software is given. The particular application discussed is the zinc/ferricyanide hybrid redox battery. The system is capable of controlling the charge and discharge cycles of six or more secondary batteries based upon five or more operator determined cell parameters, and computing at the end of each cycle the voltaic, coulombic, and energy conversion efficiencies for each cell. The system described fulfills the objective of enabling one person to control, collect, and interpret cyclic data from many cells with a minimum of effort. DOE

THEORY AND DESIGN OF AN ANNUAL CYCLE ENERGY SYSTEM (ACES) FOR RESIDENCES
E. A. Nephew, L. A. Abbatiello, and M. L. Ballou. May 1980. 357 p. refs.
(Contract W-7405-eng-26)
(ORNL/CON-43) Avail: NTIS HC A16/MF A01

The basic concept of the Annual Cycle Energy System (ACES), and integrated system for supplying space heating, hot water, and air conditioning to a building, and the theory underlying its design and operation are described. Practical procedures for designing an ACES for a single family residence, together with recommended guidelines for the construction and installation of system components, are presented. Methods are discussed for estimating the life cycle cost, component sizes, and annual energy consumption of the system for residential applications in different climatic regions of the US. DOE

N80-32905# Honeywell, Inc., Minneapolis, Minn. Energy Resources Center.
ECONOMIC EVALUATION OF THE ANNUAL CYCLE ENERGY SYSTEM (ACES). VOLUME 1: EXECUTIVE SUMMARY Final Report
May 1980. 70 p.
(Contract W-7405-eng-48)
(ORNL/Sub-7470/1-V1) Avail: NTIS HC A04/MF A01

Three different classes of building are investigated, namely: single family residence; multifamily residence; and commercial office building. For each building type in each geographic location, the economic evaluation of the annual cycle energy system (ACES) is based on a comparison of the present worth of the ACES to the present worth of a number of conventional systems. The results of this analysis indicate that the economic viability of the ACES is very sensitive to the assumed value of the property tax, maintenance cost, and fuel escalation rates, while it is relatively insensitive to the assumed values of other parameters. Fortunately, any conceivable change in the fuel escalation rates would tend to increase the viability of the ACES concept. An increase in the assumed value of the maintenance cost or property tax would tend to make the ACES concept less viable; a decrease in either would tend to make the ACES concept more viable. DOE

COMPARATIVE ANALYSIS OF ALUMINUM-AIR BATTERY PROPULSION SYSTEMS FOR PASSENGER VEHICLES
J. D. Salisbury, E. Behrin, M. K. Kong, and D. J. Whisler. 29 Feb. 1980. 103 p. refs.
(Contract W-7405-eng-48)
(UCRL-52933) Avail: NTIS HC A06/MF A01

Three electric propulsion systems using an aluminum air battery were analyzed and compared to the internal combustion engine (ICE) vehicle. The engine and fuel systems of a representative five passenger highway vehicle were replaced conceptually by each of the three electric propulsion systems. The electrical vehicles were constrained by the computer simulation to be equivalent to the ICE vehicle in range and acceleration performance. The vehicle masses and aluminum consumption rates were then calculated for the electric vehicles and these data were used as figures of merit. The Al-air vehicles analyzed were (1) an Al-air battery only electric vehicle; (2) an Al-air battery combined with a nickel zinc secondary battery for power leveling and regenerative braking; and (3) an Al-air battery combined with a flywheel for power leveling and regenerative braking. All three electric systems compared favorably with the ICE vehicle. DOE

FABRICATION OF TWO ONE-FIFTH SCALE FIBER COMPOSITE FLYWHEELS Final Report
Apr. 1980. 43 p. ref.
(Contract W-7405-eng-48)
(UCRL-15231; WMB/A-4500-95-25-R1) Avail: NTIS

HC A03/MF A01

Two fiber composite flywheel rotors were fabricated. These flywheels are scaled down versions of two automotive flywheels built for Sandia Laboratories. The flywheels store a maximum of 0.97 kWh of kinetic energy. Energy density is 87 Wh/kg at the maximum operating speed of 56,000 rpm. The nominal flywheel dimensions are 35 cm diameter by 13 cm axial height. The weight of the flywheel rotor assembly is 11.16 kg. DOE

N80-32911# Midwest Research Inst., Golden, Colo.
POTENTIAL FOR SUPPLYING SOLAR THERMAL ENERGY TO INDUSTRIAL UNIT OPERATIONS
E. Kenneth May. Apr. 1980. 13 p. refs. Presented at the 89th Ann. Meeting of AICE, Portland, Oreg., 17-20 Aug. 1980
(Contract DE-AC02-77CH-00178)
(SERI/TP-632-584; CONF-800802-3) Avail: NTIS HC A02/MF A01

Adoption of solar thermal technology, considered in terms of the end use of energy delivered to industrial unit operations was studied. The use of low temperature processes, which are more easily integrated with solar thermal technology were studied. The adoption of solar technology is favored by the relative rates of increase of the costs of electricity and natural gas, and by energy conservation measures. High temperature hot water systems are more compatible with solar technology. DOE

MONITORING OF THE PERFORMANCE OF A SOLAR HEATED AND COOLED APARTMENT BUILDING. Final Report
Gary C. Vliet and Robert L. Srubar. Mar. 1980. 95 p. refs.
(Contract EM-78-S-01-5235)
(DSE-5235-T1) Avail: NTIS HC A05/MF A01

An all electric apartment building in Texas was retrofitted for solar heating and cooling and hot water. The system consisted of an array of 1280 square feet of Northrup concentrating tracking collectors, a 5000 gallon hot water storage vessel, a 500 gallon chilled water storage vessel, a 25 ton Arkla Industries absorption chiller, and a two pipe hydronic air conditioning system. The solar air conditioning equipment was installed in parallel with the existing conventional electric heating and cooling system, and the solar domestic water heating served as preheat to the existing electric water heaters. The system was fully instrumented for monitoring. Detailed descriptions of the solar system, the performance monitoring system, and the data reduction processes are given. DOE

N80-32914# Lincoln Lab., Mass. Inst. of Tech., Lexington.
ANALYTICAL PREDICTION OF THE PERFORMANCE OF AN AIR PHOTOVOLTAIC/THERMAL FLAT PLATE COLLECTOR
P. Raghuraman. 30 Apr. 1980. 20 p. refs.
(Contract DE-AC02-76ET-20279)
(DOE/ET-20279/93) Avail: NTIS HC A02/MF A01

A one dimensional analysis predicted the electrical and thermal performance of an air photovoltaic/thermal flat plate collector. The analysis compared well with test measurements, predicting the thermal efficiency to within 2 percent. From the analysis, the poor thermal performance of the collector was attributable, in part, to the large undulations of the cell/silicon pottant surface in contact with the flowing air that resulted in less effective convective heat transfer areas between the cell and the air. DOE

N80-32915# Joint Center for Graduate Study, Richland, Wash.
[INVESTIGATION OF LOW-COST SOLAR CELLS BASED ON Cu2O] Quarterly Progress Report, 1 Nov. 1979 - 31 Jan. 1980
Larry C. Olsen. 12 Mar. 1980. 33 p. refs.
(Contract DE-AC04-79ET-23006)
(DOE/ET-23006/3; QPR-3) Avail: NTIS HC A03/MF A01

In-doped ZnS films with very good optical quality and finite conductivity were obtained by codepositing In and ZnS. Analysis of the internal photoresponse indicated that minority carrier diffusion lengths on the order of 10 micrometers are being achieved with the present Cu2O growth procedure. These devices appear to have an MIS structure or fixed charge at the interface. Another very significant achievement was the development of a surface preparation procedure which results in a nearly perfect stochiometry at the surface. DOE

SPECTRAL CHARACTER OF SOLAR AND CIRCUMSOLAR RADIATION
D. B. Evans, D. F. Grether, A. J. Hunt, and M. Wahlig. Mar. 1980. 6 p. refs. Presented at the ISES Conf., Phoenix, Ariz., 2 Jun. 1980
(Contract W-7405-eng-48)
(LBL-10802; CONF-800604-25) Avail: NTIS HC A02/MF A01

Information on the solar and circumsolar radiation (the solar aureole) for application to concentrating solar energy systems is discussed. Four instrument systems obtain detailed measurements of the solar and circumsolar intensity, both as a function of angular distance from the center of the Sun, and as a function of wavelength. A method of inverting filtered measurements to obtain the energy contained within a given wavelength interval is presented. Comparisons are made between the atmospheric transmission code LOWTRAN and normal incidence data. The amount of circumsolar radiation and the dependence of circumsolar radiation on angular distance from the Sun are discussed as a function of wavelength for selected atmospheric conditions. DOE

CdSiAs2 THIN FILMS FOR SOLAR CELL APPLICATIONS Quarterly Report, 9 Apr. - 30 Jun. 1979
L. C. Burton and L. H. Slack. 25 Jul. 1979. 51 p. refs.

best copy available

(Contract DE-AC04-79ET-23007)
(DOE/ET-23007/1) Avail: NTIS HC A04/MF A01

Near stoichiometric bulk polycrystalline CdSiAs2 was synthesized by two techniques: (1) direct fusion of the elements and (2) direct fusion of the binaries SiAs, Cd3As2 and CdAs2. The latter technique resulted in denser ternary material with good homogeneity. The above binaries melt congruently and were also formed by direct fusion. Sputtered ternary films were formed using a bulk CdSiAs2 target, and a composite target of CdAs2 discs in a Si plate. Composition of the CdSiAS2 target changed with sputtering time. Amorphous films deposited from that target were heat treated, and became crystalline and near stoichiometric but with poor mechanical properties. It appears that films deposited from the composite target (Si + CdAs2) can be adjusted to stoichiometry by means of sputtering power and target geometry. As deposited, these films also were amorphous. DOE

Theories for the capture of electrons by deep centers in hydrogenated amorphous silicon (a-Si:H) and for field dependent quantum efficiency in a-Si:H are presented. The optimization of phosphorus-doped a-Si:H carried out in four different discharge systems is described. Some details of the dc proximity and rf magnetron discharge systems are also provided. Preliminary mass spectroscopy studies of the rf magnetron discharge in both SiH4 and SiF4 are presented. Measurements of the surface photovoltage were used to estimate the distribution of surface states of phosphorus-doped and undoped a-Si:H. A detailed description of carrier generation, recombination, and transport in a-Si:H solar cells is given. Finally, some characteristics of Pd-Schottky barrier cells are described for different processing histories. DOE

ASSESSMENT OF HYDROGEN COMPRESSOR TECHNOLOGY FOR ENERGY STORAGE AND TRANSMISSION SYSTEMS. Final Report
Laxman G. Phadke, T. Nejat Vezirogiu, Richard W. Foster, and William J. D. Escher. Jan. 1979. 192 p. refs. Prepared in cooperation with Escher Technology Associates, St. Johns, Mich.
(Contract EC-77-S-05-5598)
(ORO-5598-T1) Avail: NTIS HC A09/MF A01

An initial assessment of hydrogen compressor technology for prospective energy systems applications is documented. Hydrogen, and hydrogen/natural gas blends, are generally related to the existing state of the art in natural compressors. Visits to natural gas transmission and storage facilities are reported on from the compressor applications standpoint. Present applications of hydrogen compressors, as reported by both manufacturers and users are summarized. Theoretical fluid dynamic and thermodynamic analysis of these fuel gases in compressors is provided. The implications of materials problems considered relevant to compressors are briefly discussed. Some general observations and recommendations are presented. DOE

PHOTOVOLTAIC MECHANISMS IN POLYCRYSTALLINE THIN-FILM SILICON SOLAR CELLS. Quarterly Report, 1 Sep. - 30 Nov. 1979
David Redfield. Dec. 1979. 23 p. refs.
(Contract DE-AC01-79ET-23108)
(DOE/ET-23108/2; QR-2) Avail: NTIS HC A02/MF A01

The effects of Auger recombination on the saturation current density of heavily doped semiconductors are shown to be more far reaching than was recognized. The equation generally used to predict and evaluate the saturation current in Si junctions always becomes invalid in the heavily doped cases of interest. The new procedure for determining J sub o was improved in two ways that now permit the identification of qualitative trends in J sub o in a significant manner. Experiments relating doping gradient effects to surface properties of Si solar cells provided new data on this relationship and led to the development of a simple new method for evaluating antireflection coatings. DOE

LOW-COST EPITAXIAL TECHNIQUES FOR SOLAR-CELL FABRICATION. Quarterly Technical Progress Report, 28 Sep. 1979 - 24 Dec. 1979
R. V. Davello and P. H. Robinson. Jan. 1980. 27 p. refs. Prepared for Midwest Research Inst., Golden, Colo.
(Contract EG-77-C-01-4042)
(SERI/PR-82741-1; QTPR-1) Avail: NTIS HC A03/MF A01

A candidate low cost silicon substrate, designated upgraded metallurgical grade (UMG) silicon, was obtained. The electrical, physical, and structural properties of three grades of this material were measured. An initial epitaxial growth technique was standardized and qualified for application to the growth of diagnostic and solar cell structures. Such structures were grown on the three UMG grades of substrates and the properties of these layers were compared to those of the substrates. The defect density in the epitaxial films was lower than in the substrates, but greater aerial variation was observed for the less pure, multicrystalline grades of substrates. Solar cells were fabricated in epitaxial structures grown on all three UMG grades of substrates. DOE

RESEARCH ON Cu SUB x S/(Cd, Zn)S PHOTOVOLTAIC SOLAR ENERGY CONVERTERS. Final Report, Mar. 1977 - Sep. 1979
B. L. Chin, T. M. Peterson, U. Dahmen, K. Seshan, L. E. Sindelar, and J. Washburn. Mar. 1980. 119 p. refs.
(Contract W-7405-eng-48)
(LBL-10791) Avail: NTIS. HC A06/MF A01

The factors affecting the operation of CdS/Cu/sub x/S and (Cd,Zn)S/Cu/sub x/S photovoltaic cells were studied. The approach was to systematically study the single crystal heterojunction so as to eliminate the complicating effects of grain boundaries. Single crystal CdS and (Cd,Zn)S thin films were deposited onto both GaAs and Ge substrates by a hot wall vacuum deposition technique. These grown films were studied using X-ray diffraction, SEM-EDAX, TEM and Hall Effect experiments. Information concerning the effects of varying processing parameters on the chemical and structural nature of the deposited films was obtained. Detailed TEM studies revealed the presence of different dislocation structures which affect the cell performance. The relationship between structural information and cell operation was studied. DOE

Basically, the Solar Index represents the percentage of energy that solar would provide in order to heat an 80 gallon service hot water load for a given location and day. The Index is computed by utilizing SOLOCOST, a computer program, which also has applications to space heating, cooling, and heat pump systems and which supplies economic analyses for such solar energy systems. The Index is generated for approximately 68 geographic locations in the country on a daily basis. The definition of the Index, how the project came to be, what it is at the present time and a plan for the future are described. DOE

DESIGN EVOLUTION AND VERIFICATION OF THE GENERAL-PURPOSE HEAT SOURCE
A. Schock. [1980]. 11 p.
(Contract DE-AC02-77ET-33021)
(DOE/ET-33021/T1) Avail: NTIS. HC A02/MF A01

The general purpose heat source employs a modular design. Each 250 W module is completely autonomous, with its own passive safety provisions to prevent fuel release under all abort modes, including atmospheric reentry and Earth impact. This requires high impact temperatures, typically above 900 C and reasonably fine grain size, which in turn requires avoidance of excessive operating temperatures and reentry temperatures. These three requirements - on operating, reentry, and impact temperatures are in mutual conflict, since thermal design changes to improve any one of these temperatures tend to worsen one or both of the others. This design problem was overcome by successive design revisions, supplemented by thermal analyses and confirmatory vibration and impact tests. R.K.G.

DEVELOPMENT OF COPPER SULFIDE/CADMIUM SULFIDE THIN FILM SOLAR CELLS. Technical Progress Report, 13 Jul. - 12 Oct. 1979
J. R. Szedon, F. A. Shirland, J. A. Stoll, and H. C. Dickey. 14 Feb. 1980. 36 p. refs.
(Contract EG-77-C-01-4042)
(DSE-4042-T42; TPR-1) Avail: NTIS. HC A03/MF A01

Preparation of CdS films by evaporation from a single graphite source, as generally used by the Institute of Energy Conversion (IEC) group at the University of Delaware, was implemented. Previously, four evaporation sources were used to permit uniform coverage of large area substrates. The graphite source used in this period is somewhat smaller than the IEC design to permit accommodation to the heater geometry currently available. Initial efforts with the single source evaporation were on characterizing the thickness profiles of the deposited films. This is needed to permit selection of conditions for obtaining films of about 30 microns thickness over the central 4 cm x 4 cm area of the substrates. Barrier processing according to the details of IEC method was used on four source CdS films. To date the best cells have only been about 1% efficient. Low short circuit current density values (approximately 5 mA/sq cm) have been the biggest problem. Annealing in 6% H2/Ar mixtures at 170 C after electrode grid evaporation generally has resulted in reduced values of J/sub sc/. DOE

CUPROUS OXIDE PHOTOVOLTAIC CELLS. Quarterly Technical Progress Report, 9 Jan. - 8 Apr. 1980
Dan Trivich. 8 Apr. 1980. 37 p. refs.
(Contract DE-AC04-79ET-23010)
(DOE/ET-23010/17; QTPR-4) Avail: NTIS. HC A03/MF A01

Metal insulator semiconductor cells and heterojunction cells with Cu2Owere studied. In particular the junctions were studied by Auger techniques to detect possible chemical changes at the interface. It was found that some preparation conditions could produce heterojunctions without chemical degradation. The effect of impurities in the starting Cu on the properties of the Cu2O and Cu2O solar cell was examined. Methods of measuring diffusion length were explored. DOE

THIN FILMS OF SILICON ON METALLURGICAL SILICON SUBSTRATES. Final Report, 1 Sep. 1976 - 30 Sep. 1979
Ting L. Chu. Sep. 1979. 98 p. refs.
(Contracts EY-76-C-03-1285; DE-AC03-76ET-20405)
(SAN-1285-T2) Avail: NTIS. HC A05/MF A01

Metallurgical silicon was purified by a low cost technique, acid-extraction and phosphorus pentoxide treatment, to yield materials suitable for substrate purposes. Recrystallization techniques were developed to produce large grain silicon sheet supported on graphite. Silicon films of controlled thickness and dopant distribution were deposited on metallurgical silicon substrates, and the properties of silicon films and epitaxial p-n junctions were investigated in detail. Polycrystalline silicon solar cells were fabricated, and their properties including current-voltage characteristics, spectral response, minority carrier diffusion length, dopant profile, and stability, were characterized in detail. The properties of grain boundaries in polycrystalline silicon solar cells were investigated by photoresponse scan and EBIC techniques. DOE

Sponsored by Solar Energy Research Inst.
(Contract DE-AC02-77CH-00178)
(DOE/CH-00178-T2; QTPR-2) Avail: NTIS. HC A05/MF A01

Design modifications were made to incorporate thermocouples into the polysilicon casting furnace to allow for the constant monitoring of the temperature profile during the casting process. A source of metallurgical grade (MG) silicon was chosen and the material was prepared by grinding the large pieces into powder. The uniformity of the feedstock was ascertained by optical emission spectrograph analysis of three random samples of the feedstock. A total of sixteen casting runs were made this quarter; Union Carbide CMG graphite was found to be the most suitable crucible material. Solar cells were fabricated from the successful castings (five 100% SG, and two containing 1% and 5% MG silicon, respectively). The average efficiency from the first SG ingot was 10.4% AM0 (in excess of 12% AM1). In general, solar cells fabricated from the top and bottom of the ingots exhibited better overall characteristics. The addition of MG silicon to the casting caused a large degradation in both light and dark I-V characteristics. DOE

US NATIONAL PHOTOVOLTAICS PROGRAM AND APPLICATIONS EXPERIMENTS IN THE INTERMEDIATE SECTOR
Miguel Rios, Jr. 1980 35 p refs
(Contract DE-AC04-76DP-00789)
(SAND-80-0587C) Avail: NTIS HC A03/MF A01

The Department of Energy (DOE) commercial readiness goals for photovoltaics technology are summarized and the role of the national labs, research centers, and institutes in the strategy for achievement of these goals is outlined. Some examples of the flatplate and concentrator photovoltaics experiments that are under construction through the DOE Program Research and Development Announcements (PRDAs) are discussed. These experiments establish system feasibility and demonstrate the applicability of photovoltaics as an alternative energy source in the intermediate sector (industrial, commercial, and agricultural). Installed system costs for the proposed PRDAs are given and concentrator technology requirements for achievement of DOE commercial readiness goals are presented. DOE

FEASIBILITY STUDY ON A SOLAR HOUSE HEATING SYSTEM WITH A LOW QUALITY THERMAL FLOW Final Report
A. Eggers-Lura 1980 237 p refs
(EUR-6696-EN) Avail: NTIS (US Sales Only) HC A11/MF A01; DOE Depository Libraries

A solar energy/heatpump house heating system with a low quality thermal flow, and of integration into prefabricated concrete element buildings were studied. Denmark's energy problem, its energy policy, and its housing and building industry are briefly described. A survey is made of existing buildings in Europe which use high density walls/roofs as solar collectors, and of research and development work being undertaken in EEC on concrete solar collectors. The component that comprise a solar heating system integrated into a prefabricated concrete building structure are described. Feasibility of a solar/heatpump heating system integrated into a prefabricated one family dwelling of the dense, low level type was studied. Descriptions of the building and its heating system are given. Heat balance calculations private economy and energy economy calculations of the house and its alternative heating system are presented, and finally recommendations are made as to future work. DOE

ANALYSIS OF ALUMINUM-AIR BATTERY PROPULSION SYSTEMS FOR PASSENGER VEHICLES
J. D. Salisbury and E. Behrin 1 May 1980 10 p refs Presented at 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 17-22 Aug. 1980
(Contract W-7405-eng-48)
(UCRL-83824; CONF-800806-15) Avail: NTIS HC A02/MF A01

The performance characteristics of three electric propulsion systems based on the aluminum air(AL-air) battery were analyzed and compared to the internal combustion engine (ICE). In this comparison, the engine and fuel systems of a current five passenger vehicle were conceptually replaced by three Al-air systems; (1) an Al-air battery only system; (2) an Al-air battery combined with a nickel-zinc secondary battery for power leveling; and (3) an Al-air battery combined with a flywheel power leveler. Performance characteristics such as the average consumption rate of Al metal for the selected drive cycle, vehicle mass, and power system mass were determined for each Al-air propulsion system. Estimates of initial vehicle and life cycle costs of Al-air battery only vehicles indicate that all three systems can achieve performance and operation costs comparable to an ICE vehicle, and that the initial cost of Al-air battery only vehicles can approach the cost of ICE vehicles but at reduced power levels. DOE

ALUMINUM AIR BATTERY FOR ELECTRIC VEHICLE PROPULSION
John F. Cooper, Robert V. Homsy, and Jerry H. Landrum 1980 10 p refs Presented at 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 18-22, Aug. 1980 Submitted for publication
(Contract W-7405-eng-48)
(UCRL-84443; CONF-800806-19) Avail: NTIS

HC A02/MF A01

Aluminum air battery development and the use of aluminum as a recyclable electrochemical fuel are discussed. The battery combines high specific energy (above 300 Wh/kg) and specific power (150 to 200 W/kg) with the capability of rapid refueling by addition of reactants. The objective is a commercially feasible, general purpose electric vehicle. Progress is reported in the scale up of aluminum air single cells to the automotive scale (0.1 m2 anodes) and in the development of a hydrargillite crystallizer, which is required to control electrolyte composition. The total cost and energy required to produce aluminum, and projected consumption by electric vehicles indicates that the aluminum air powered electric vehicle is potentially competitive with advanced automobiles using synthetic liquid fuels. DOE

ENGINEERING TEST FACILITY CONCEPTUAL DESIGN Final Technical Report
Feb. 1980 159 p
(Contract EF-77-C-01-2614)
(DOE/FE-2614/3) Avail: NTIS HC A08/MF A01

The power system configuration originally specified for the ETF considered the use of a high temperature air preheater, separately fired initially with oil and subsequently with a LBtu gas produced in a coal gasifier integrated with the power plant. This eliminates the need for a high temperature air preheater and its associated gasifier. The results from initial parametric design analysis in the separate study of early commercial MHD power plants reinforced the potential attractiveness of the use of oxygen enrichment of the combustion air. Preliminary analysis of the use of oxygen enrichment for ETF is also included. DOE

THE 3X COMPOUND PARABOLIC CONCENTRATING (CPC) SOLAR ENERGY COLLECTOR Final Technical Report
Robert W. Ballheim 25 Apr. 1980 207 p refs
(Contract DE-AC04-78CS-04239)
(DOE/CS-04239/T1; CMC-CB178-PR-017) Avail: NTIS HC A10/MF A01

A 3X compounds parabolic concentrating (CPC) collector was designed. The collector is a completely housed, 105.75 x 44.75 x 10.23 inch, 240 pound unit with six each evacuated receiver assemblies, a center manifold and a one piece glass cover. A truncated version of a CPC trough reflector system and the General Electric Company tubular evacuated receiver were integrated with a mass producible collector design suitable for operation at 250 to 450 F. The key criterion for optimization of the design was minimization of the cost per Btu collected annually at an operating temperature of 400 F. The reflector is a 4.1X design truncated to a total height of 8.0 inches with a resulting actual concentration ratio of 2.6 to 1. The manifold is an insulated area housing the fluid lines which connect the six receivers in series with inlet and outlet tubes extending from one side of the collector at the center. DOE

N80-32945# SRI International Corp., Menlo Park, Calif.
LINE-FOCUS SOLAR CENTRAL POWER SYSTEM, PHASE 1. SUBSYSTEM EXPERIMENT: RECEIVER HEAT TRANSFER
Arthur J. Slemmons Apr. 1980 125 p refs
(Contract EY-76-C-03-0115)
(DOE/ET-20550/1) Avail: NTIS HC A06/MF A01

Wind tunnel tests confirmed that heat losses due to natural convection are negligible in the line focus, solar powered receiver. Anomalies in the forced convection tests prevented definitive conclusions regarding the more important forced convection. Flow-visualization tests using a water table show much lower velocities inside the receiver cavity than outside, supporting the supposition that the forced heat transfer should be less than that from a standard exposed cylinder. Furthermore, the water table tests showed ways to decrease the low velocities in the cavity should this be desired. Further wind tunnel testing should be done to confirm estimates and to support advanced design. This testing can be done in standard wind tunnels since only the forced convection is of concern. DOE

THERMOGRAPHIC TECHNIQUES APPLIED TO SOLAR COLLECTOR SYSTEMS ANALYSIS
Anthony Eden Feb. 1980 8 p refs Presented at ASME Century 2 Emerging Energy Technol. Conf., San Francisco, 19-21 Aug. 1980
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(SERI/TP-351-540; CONF-800804-20) Avail: NTIS HC A02/MF A01

The use of thermography to analyze large solar collector array systems under dynamic operating conditions is discussed. The research focused on thermographic techniques and equipment to determine temperature distributions, flow patterns, and air blockages in solar collectors. The results, covering many sites and types of collectors, illustrate the capabilities of infrared (IR) analysis as a qualitative analysis tool and operation and maintenance procedure when applied to large arrays. Thermographic analysis of most collector systems qualitatively showed relative temperature distributions that indicated balanced flow patterns. In three significant cases, blocked or broken collector arrays, which previously had gone undetected, were discovered. Using this analysis, validation studies of large computer codes could examine collector arrays for flow patterns or blockages that could cause disagreement between actual and predicted performance. DOE

SOLAR PONDS AND THEIR APPLICATIONS
T. S. Jayadev and M. Edesess Mar. 1980 12 p refs Presented at the 7th Energy Technol. Conf. and Exposition, Washington, D.C., 25 Mar. 1980
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(SERI/TP-733-617; CONF-800352-4) Avail: NTIS HC A02/MF A01

Solar ponds are probably the simplest and least expensive technology for conversion of solar energy to thermal energy. The solar pond is unique in its ability to act both as collector and as storage. The cost of a solar pond per unit area is considerably less than that of any active collector available today. The combination of their economic and technical factors make solar ponds attractive for district heating and industrial process heat applications. Solar ponds have the potential to displace significant quantities of fossil fuel in low-temperature heating applications in nonurban areas. DOE

PERFORMANCE OF STORAGE WALLS WITH HIGHLY CONDUCTIVE COVERING PLATES AND CONNECTING FILMS
Joseph K. E. Ortega, Carl E. Bingham, and J. Michael Connolly May 1980 9 p refs
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(SERI/TP-721-574) Avail: NTIS HC A02/MF A01

The thermal behavior of a storage wall, constructed of concrete with highly conductive plates and connecting vertical fins, is investigated. The results demonstrate that, during the charging mode, the amount of energy released from the front surface is significantly reduced. A portion of the saved energy is stored for future discharge, but a large portion is transferred to the back surface and released. A selective front surface reduces the energy released from the front surface, and this energy is

stored. By properly selecting the fin spacing, plate-fin thickness, and plate-fin thermal conductivity, the rate and direction of thermal discharge can be controlled. The improved heat transfer capability and added thermal control provide new alternatives for interzonal heat transfer and multizone passive building designs. DOE

COMPUTER MODELING OF THERMAL STORAGE WALLS
J. Michael Connolly, Carl E. Bingham, and Joseph K. E. Ortega May 1980 7 p refs
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(SERI/TP-721-610) Avail: NTIS HC A02/MF A01

The modeling of the three dimensional heat transfer characteristics of thermal storage walls and the effect of nonuniform irradiation is investigated. Depending on how much of the wall is irradiated, a small error in energy storage is introduced with the one dimensional, uniform irradiation assumption. The results show that these assumptions, currently used in most passive design codes, are adequate to predict the thermal energy storage characteristics. However, the temperature distribution along the surface of the wall is much different when the nonuniform irradiation case is considered. The addition of a highly conductive metal cover on the front surface of the wall does not significantly improve the thermal energy storage characteristics of the wall when the wall is partially irradiated. A selective radiation coating reduces front losses and improves the energy storage capacity of the wall 9 to 13%. DOE

SELF CONTROLLING, SELF PUMPING HEAT CIRCULATION SYSTEM STUDY Final Report, 1 Aug. 1977 - 31 Jul. 1978
G. P. Wachtell 31 Jul. 1978 153 p refs
(Contracts DE-AC02-77CS-34484; EG-77-C-02-4484)
(COO-4484-07; FRC-C4772-2) Avail: NTIS HC A08/MF A01

Self pumping methods for transporting heat from roof-mounted flat plate solar collectors to thermal energy storage at a lower evaluation are described and evaluated. Power cycles are feasible for sensible heat transport with air or water, and also in latent heat transport systems. Vapor bubble lift for circulating water and latent heat transport with condensate return by the vapor stream are recommended for development as devices with no moving parts. Development of an injector for circulating liquid is also recommended, although higher collector temperatures or circulants that are more volatile than water would be needed. Some methods of delivering heat to the TES using photovoltaic power or small amounts of utility power were evaluated. DOE

OXIDATION OF ELECTRODEPOSITED BLACK CHROME SELECTIVE SOLAR ABSORBER FILMS
P. H. Holloway, K. Shanker, R. B. Pettit (Sandia National Labs.), and R. R. Sowell (Sandia National Labs.) 1980 19 p refs
Presented at the Intern. Conf. on Met. Coatings, San Diego, Calif., 21 Apr. 1980
(Contracts DE-AC04-76DP-00789; DE-FG02-79ER-10541)
(SAND-80-1045C; CONF-800439-11) Avail: NTIS HC A02/MF A01

X-ray photoelectron and Auger electron spectroscopes were used to study the composition and oxidation of electrodeposited black chrome films. The outer layer of the film is Cr2O3 with the inner layer being a continuously changing mixture of Cr + Cr2O3. Initially, approximately 40 percent by volume of the film is combined as Cr2O3, and the volume percentage of Cr2O3 increases to greater than 60 percent after only 136 hours at 250 C. After approximately 3600 hours at 400 C, the volume percentage of Cr2O3 increased to as high as 80 percent. The thermal emittance decreased approximately linearly with increasing oxide content, while the solar absorptance remained constant until the percentage of Cr2O3 exceeded approximately 70 percent. Oxidation was slower when the Cr(+3) concentration in the plating bath was reduced from 16 g/l to 8 g/l, and when black chrome was deposited on stainless steel rather than sulfamate nickel. DOE

MODEL OF DIRECT CONTACT HEAT TRANSFER FOR LATENT HEAT ENERGY STORAGE
Michael E. Cease May 1980 8 p refs Presented at the 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 18-22 Aug. 1980
(Contracts EG-77-C-01-4042; DE-AC02-77CH-00178)
(SERI/TP-631-567; CONF-800806-27) Avail: NTIS HC A02/MF A01

In a direct contact heat transfer system, an immiscible fluid was bubbled through the storage media and heat was transferred between the phases as the droplets rose. An analytical model is presented for predicting the temperature of the rising droplets from information in the literature. The drop size was calculated from empirical correlations in the jetting formation region and rise velocity was characterized by a creeping-flow surface cell model which accounts for the hindering effects of neighboring droplets. The viscosity of the crystallizing solution in the rise velocity equation was approximated by an expression for concentrated suspensions, where the percentage of solids was taken as the percentage of crystallization. Dispersed phase holdup was predicted with the rise velocity. Calculation of the rate of heat transfer to the dispersed immiscible fluid droplets was based

on three different internal hydrodynamic approximations: rigid, internally circulating, and wall-mixed spheres. DOE

DEVELOPMENT OF AN 8 kW WIND TURBINE GENERATOR FOR RESIDENTIAL TYPE APPLICATION. PHASE 1: DESIGN AND ANALYSIS. VOLUME 1: EXECUTIVE SUMMARY
M. C. Cheney et al 25 Jun. 1979 8 p
(Contract DE-AC04-76DP-03533)
(DOE/DP-03533/T1-Vol-1) Avail: NTIS HC A02/MF A01

Special features of the composite bearingless rotor, developed initially for helicopter application, were used in the design of a prototype wind turbine whose blade is comprised of an outer or aerodynamic portion fabricated from fiberglass using a pultrusion process, and an inner portion, called the flexbeam which is made up of unidirectional graphite epoxy. A rotor diameter of 9.4m was selected, producing more than the required 8 kW at 9m/s wind speeds, more typical of residential areas. Performance was calculated for two rotor speeds, representing two different gearbox step up ratios. Design studies and supporting analytical efforts show that the 8 kW prototype satisfies program objectives relative to performance and operational characteristics. Stability and loads calculations, using stabilized helicopter aeroelastic codes, demonstrate the system is well damped under all loading conditions and operates well below allowable stress levels. System costs are running about 20% higher than the contract goals; however, reductions in the main frame and tower costs appear feasible, and would be explored in a second generation 8 kW design. A.R.H.

APPRAISAL OF THE M FACTOR AND THE ROLE OF BUILDING THERMAL MASS IN ENERGY CONSERVATION
K. W. Childs Jul. 1980 51 p refs
(Contract W-7405-eng-26)
(ORNL/CON-46) Avail: NTIS HC A04/MF A01

A concept in heat transfer calculations known as the M factor was introduced to account for thermal storage due to mass in building walls. The assumptions behind the development of the M factor are reviewed. The effect of mass in walls on seasonal or annual energy transmission through walls is examined, as well as the applicability of the M factor as a correction to account for any mass effects. In connection with the effect of mass on seasonal energy consumption, the use of an M factor correction when checking a building for compliance with energy conservation standards is investigated. The suitability of applying the M factor correction to the peak load determined by a steady state calculation for equipment sizing is also explored. In addition, the relationship of thermal mass to other parameters that determine loads and energy consumption is investigated, and the role of thermal mass in energy conservation is discussed. DOE

POTENTIAL DISPLACEMENT OF PETROLEUM IMPORTS BY SOLAR ENERGY TECHNOLOGIES
Peter DeLeon, Byron L. Jackson, Robert F. McNown (Colorado Univ., Boulder), and Gary J. Mahrenholz (Colorado Univ., Boulder) May 1980 59 p refs
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(SERI/TR-352-504) Avail: NTIS HC A04/MF A01

The United States currently imports close to half of its petroleum requirements. The economic, social, and political costs of a foreign oil dependency are discussed. Development of alternative, domestic energy sources, such as solar energy technologies, which can displace foreign petroleum is discussed. It is estimated that by the year 2000, solar energy technologies can displace 3.6 quads of petroleum. This figure includes solar energy applications in utilities, industrial and agricultural process heat, and transportation. The estimate can be treated as a lower bound; if the United States were to achieve the proposed goal of 20 quads by 2000, the amount of displaced oil probably would be greater. Although all the displaced oil would not be imported, the reduction in imported petroleum would relieve many of the conditions that increase the present cost of foreign oil to the American consumer. DOE

DEVELOPMENT OF AN ENERGY CONSUMPTION AND COST DATA BASE FOR FUEL CELL TOTAL ENERGY SYSTEMS AND CONVENTIONAL BUILDING ENERGY SYSTEMS
G. D. Pine, J. E. Christian, W. R. Mixon, and W. L. Jackson Jul. 1980 75 p refs
(Contract W-7405-eng-26)
(ORNL/CON-38) Avail: NTIS HC A04/MF A01

The procedures and data sources used to develop an energy consumption and system cost data base for use in predicting the market penetration of phosphoric acid fuel cell total energy systems in the nonindustrial building market are described. A computer program was used to simulate the hourly energy requirements of six types of buildings: office buildings; retail stores; hotels and motels; schools; hospitals; and multifamily residences. The simulations were done by using hourly weather tapes for one city in each of the ten Department of Energy administrative regions. Two types of building construction were considered, one for existing buildings and one for new buildings. A fuel cell system combined with electrically driven heat pumps and one combined with a gas boiler and an electrically driven chiller were compared with similar conventional systems. The methods of system simulation, component sizing, and system cost estimation are described for each system. DOE

THE EFFECT OF DESIGNATED POLLUTANTS ON PLANT SPECIES Annual Report, 1 Jul. 1978 - 30 Jun. 1979
A. L. Granett and O. C. Taylor Dec. 1979 64 p refs
(Contract F33615-76-C-5005)
(AD-A078933; AMRL-TR-79-73; AR-4) Avail: NTIS HC A04/MF A01 CSCL 13/2

The phototoxicity of hydrogen chloride (HC1) gas was studied with particular emphasis on various external plant stresses. Greenhouse grown plants and indoor exposure chambers were utilized to test the effect of viral infection, insecticide treatment, weed killer applications, or antioxidant protectants on injury caused by HC1 gas. Plant sensitivity did not differ between virus infected and non viral plants. Increased injury, however, was seen on plants exposed to HCl gas after one of the insecticide treatments. An experimental antioxidant compound which protects plants from ozone injury did not increase tolerance to HCl gas. Some plants were fumigated only once while others received weekly doses. Field plants were generally more tolerant than the same species grown in the greenhouse. HCl for the field work was generated either by diluting pressurized dry gas in a large volume of flowing carrier gas or by open burning of small pieces of solid rocket fuel. Portable chambers remained over the field plants only for the duration of the 15 minute exposures. T.M.

PERFORMANCE TESTS OF HIGH SPEED ZRV OIL SKIMMER Final Report, 8 Sep. - 13 Oct. 1979
Michael K. Breslin (Mason and Hanger-Silas Mason Co., Inc.) Jun. 1980 156 p refs
(Contract DOT-CG-842702-A)
(AD-A088062; USCG-D-42-80) Avail: NTIS HC A08/MF A01 CSCL 13/11

A self-propelled catamaran oil skimmer developed by the USCG capable of recovering oil from a water's surface was tested at the U.S. EPA OHMSETT facility. The skimmer employed an endless composite sorbent belt processed between the catamaran hulls to recover oil. The tests were designed to determine the effect that various parameters (skimmer speed, oil viscosity, oil thickness, wave conditions, etc.) have upon oil recovery performance. The skimmer was towed through oil slicks at various speeds in different wave conditions as it was operated to collect oil. The collected fluid was quantitatively analyzed to determine the device's oil-to-water recovery ratio (recovery efficiency), oil recovery rate and thoroughness of slick removal (throughput efficiency). The device proved capable of good throughput efficiency in all wave conditions (up to 0.7 m confused seas) at all the tow speeds tested (1 to 6 knots). Throughput efficiencies of 80 to 90% in calm water were common with all the oils tested. The performance of the full-scale skimmer agreed well with the results from the smaller prototype tested in 1976. The successful development of this skimmer provides a significant advance in oil spill recovery capability and technology. The concept used in this oil skimmer can be employed at speeds greater than those tested. Two oil slick converging systems were tested with the skimmer to effectively double the sweep width of the skimmer. Additional tests were conducted to determine vessel resistance and motion in waves and to assess the buildup of potentially explosive vapors within the oil recovery system. GRA

ENVIRONMENTAL CONTROL TECHNOLOGY FOR CARBON DIOXIDE Final Report
Anthony S. Albanese and Meyer Steinberg May 1980 30 p refs
(Contract DE-AC02-76CH-00016)
(DOE/EV-0079) Avail: NTIS HC A03/MF A01

The impact of fossil fuel use in the US on worldwide CO2 emissions and the impact of increased coal utilization on CO2 emission rates are assessed. The aspects of CO2 control are discussed as well as the available CO2 removal sites. The primary factor affecting the practicability of a CO2 control system is its energy requirements. At a CO2 removal efficiency of 50%, the power generation efficiency of a conventional coal fired power plant would be reduced from 34% to about 25%, and the cost of power generation would be expected to double. For 90% CO2 removal, power generation efficiency is reduced to between 15 and 6% and the cost of power generation increases by a factor of from 4 to 7. DOE

ASSESSMENT OF ENVIRONMENTAL CONTROL TECHNOLOGIES FOR ENERGY STORAGE SYSTEMS, 1979
M. C. Krupka, J. E. Moore, W. E. Keller, G. A. Baca, R. I. Brasier, and W. S. Bennett Apr. 1980 123 p refs
(Contract W-7405-eng-36)
(LA-8308-MS) Avail: NTIS HC A06/MF A01

Environmental impacts are identified, control techniques are described and recommendations for needed control technology are made. The storage technologies investigated include: lead acid battery, hydroelectric pumped, superconducting magnet, compressed air, flywheel and thermal. Environmental impacts of fuel cell technology is also presented. Although not strictly energy storage devices, many of the benefits attributed to fuel cells are similar to those of the other storage systems. In addition, sections on new applications for energy storage technologies and the additional costs of controls to be used for mitigation of certain adverse impacts are also presented. Detailed discussion of the various environmental impacts as they relate to primarily operational situations are emphasized. DOE

The rate constants for the reaction OH + NH3 yields NH2 + H2O were measured over the temperature range 294 to 1075 K. The data are fitted by the Arrhenius expression k(cc/molecule/s) = 5.41 + or - 0.86 x 10 to the minus 12th power exp(-2120 + or - 143 kcal/mole/RT). A chemical model of the NOx chemistry was developed which includes 54 reactions. Although not yet complete, the reaction set clearly indicates the key reaction is NH2 + NO. The determination of the product channels and their branching ratios is of utmost importance in understanding the effect of NH3 addition to combustor exhaust streams for removal of NOx. DOE

MICROCOSMS AS POTENTIAL SCREENING TOOLS FOR EVALUATING TRANSPORT AND EFFECTS OF TOXIC SUBSTANCES
B. S. Ausmus, G. K. Eddlemon, S. J. Draggan, J. M. Giddings, D. R. Jackson, R. J. Luxmoore, E. G. ONeill, R. V. ONeill, Monte Ross-Todd, and P. VanVoris Jun. 1980 404 p refs Prepared in cooperation with ORNL
(Contract W-7405-eng-26)
(ORNL/EPA-4; EPA-600/3-80-042; Publ-1506) Avail: NTIS HC A18/MF A01

Terrestrial and aquatic microcosms were evaluated for use in research on environmental contaminants. A number of experimental approaches using several microcosm designs and contaminants are reported. The use of terrestrial microcosm results was evaluated in conjunction with mathematical simulation models as a means of extending short term experimental results to interpret conditions as they might occur in the natural ecosystem. Although microcosms offer an excellent experimental system, their application to toxic substance testing is not a straightforward matter. They are characterized by complex dynamics and counterintuitive responses just as is the ecosystem to which they are an analog. These factors notwithstanding, microcosms do offer an excellent means of studying specific aspects of contaminant behavior and ecosystem processes. DOE

N80-32980# Brookhaven National Lab., Upton, N. Y. Dept. of Energy and Environment.
SENSITIVITY OF THE EASTERN UNITED STATES TO ACID PRECIPITATION IMPACTS ON SURFACE WATERS
George R. Hendrey, James N. Galloway (Virginia Univ.), Stephen A. Norton (Maine Univ., Orono), and Carl L. Schofield (Cornell Univ.) Mar. 1980 7 p refs Presented at the Intern. Conf. on the Ecol. Impact of Acid Precipitation, Sandefjord, Norway, 11-14 Mar. 1980
(Contract DE-AC02-76CH-00016)
(BNL-27851; CONF-800365-3) Avail: NTIS HC A02/MF A01

Efforts to identify areas of the United States where soils and freshwaters might be sensitive to acidification proceeded from analyses of large scale geologic maps. These are useful in a general way but a finer scale analysis was needed. Such an analysis for the eastern United States was carried out, based primarily on geologic maps of scales 1:250,000 to 1:500,000. Other workers have prepared maps on a similar scale of the soils to a depth of 25 cm, and it is anticipated that both sets of maps will be merged into a combined analysis of sensitivity. Other factors important in controlling acidification of soils and freshwaters include hydrologic characteristics of the terrain, such as: soil porosity or permeability; water residence time in soil; temporal variation in precipitation rate, chemistry and volume; regional temperature patterns; and topography. DOE

MODELING THE ROLE OF TERRESTRIAL ECOSYSTEMS IN THE GLOBAL CARBON CYCLE
William E. Emanuel, Wilfred M. Post, and Herman H. Shugart, Jr. 1980 16 p refs Presented at the 11th Ann. Modeling and Simulation Conf., Pittsburgh, 1 May 1980
(Contract W-7405-eng-26; Grant NSF DEB-77-26722)
(CONF-800549-3) Avail: NTIS HC A02/MF A01

A model for the global biogeochemical cycle of carbon which includes a five compartment submodel for circulation in terrestrial ecosystems of the world is presented. Although this terrestrial submodel divides carbon into compartments with more functional detail than previous models, the variability in carbon dynamics among ecosystem types and in different climatic zones is not adequately treated. A model construct which specifically treats this variability by modeling the distribution of ecosystem types as a function of climate on a 0.5 deg latitude by 0.5 deg longitude scale of resolution is proposed. DOE

N80-32982# Sandia Labs., Albuquerque, N. Mex. Health Physics Div.
SANDIA NATIONAL LABORATORIES 1979 ENVIRONMENTAL MONITORING REPORT
Theodore N. Simmons Apr. 1980 28 p refs
(Contract DE-AC04-76DP-00789)
(SAND-80-0342) Avail: NTIS HC A03/MF A01

Sandia National Laboratories in Albuquerque is located south of the city on two broad mesas. The local climate is arid continental. Radionuclides are released from five technical areas from the laboratories' research activities. The environmental monitoring program searches for cesium (137), tritium, uranium, alpha emitters, and beta emitters in water, soil, air, and vegetation. No activity was found in public areas in excess of local background in 1979. The Albuquerque population receives only 0.076 person-rem (estimated) from airborne radioactive releases. While national security research is the laboratories' major responsibility, energy research is a major area of activity. Both these research areas cause radioactive releases. DOE

N80-32983# Oak Ridge Associated Universities, Tenn. Inst. for Energy Analysis.
CONSTRAINTS ON CARBON DIOXIDE PRODUCTION FROM FOSSIL FUEL USE
Ralph M. Rotty and Gregg Marland May 1980 37 p refs
(Contract DE-AC05-76OR-00033)
(ORAU/IEA-80-9(M)) Avail: NTIS HC A03/MF A01

The exponential growth of fossil fuel use over recent decades has resulted in a 4.3% annual increase in the carbon dioxide emitted to the atmosphere. Three types of possible constraints to limit the use of fossil fuels and the subsequent production of CO2 are discussed: resource contraints; fuel demand constraints; and environmental constraints. An analysis of the next 50 years suggests that resource constraints will not provide severe limits. Fuel demand constraints will probably limit the use of fossil fuels to levels that keep the atmospheric carbon dioxide concentration below 450 ppM(v) for the next 50 years, so that the impacts of atmospheric carbon dioxide will not cause mankind to take action soon. In spite of this conclusion a continuing, long term problem is foreseen and full efforts to understand and continually monitor the CO2 problem should be made and alertness to any changes that may require action should be maintained. DOE

N80-32984# California Univ., Berkeley. Lawrence Berkeley Lab. Energy and Environment Div.
OCCUPANT-GENERATED CO2 AS AN INDICATOR OF VENTILATION RATE
Isaac Turiel and John Rudy Apr. 1980 24 p refs
(Contract W-7405-eng-48)
(LBL-10496; EEB-Vent-80-15) Avail: NTIS HC A02/MF A01

In a San Francisco office building, occupant-generated CO2 was used as an indicator of the actual ventilation rate. Two techniques were employed, a decay method and an integral method and, in both cases, measurements were conducted simultaneously at several locations. The decay method compared favorably with the conventional measurement methods in both the all-outside-air and recirculation modes, whereas the integral method showed a considerable deviation from the other methods in the recirculation mode. Both techniques show promise of being suitable methods for measuring ventilation rate in commercial or institutional buildings. DOE

PERFORMANCE EVALUATION OF THE AERATED LAGOON SYSTEM AT NORTH GULFORT, MISSISSIPPI Final Report, 1 Aug. 1975 - 31 Jul. 1977

Andrew J. Englande, Jr. Mar. 1980 266 p
(Grant EPA-R-803899)
(PB80-187461; EPA-600/2-80-006) Avail: NTIS
HC A12/MF A01 CSCL 13B

Results indicate that the treatment system did not exceed the federal biochemical oxygen demand average monthly requirement of 30 mg/l nor the seven consecutive day limit of 45 mg/l. The stringent permit level of 15 mg/l set by the Mississippi Air and Water Pollution Control Commission, however, was exceeded in all cases. A yearly average of 30.7 mg/l of Total Suspended Solids was recorded. The system never exceeded federal or state pH criteria. Fecal coliform standards of 200 colonies/100 ml were met only during the months of January and February. Non compliance was due to low residual chlorine levels resulting from poor design and operational control. Other parameters were monitored, summarized, and discussed. GRA

ENVIRONMENTAL DATA FOR SITES IN THE NATIONAL SOLAR DATA NETWORK

May 1980 220 p
(Contract DE-AC01-79CS-30027)
(SOLAR/0010-80/05) Avail: NTIS HC A10/MF A01

The National Solar Data Program established solar energy systems in residential and commercial buildings across the United States. These solar sites are linked to a computer in the National Solar Data Network (NSDN). Data from this network are collected and analyzed to determine the thermal performance of each of the solar systems. The network consists of:(1) sensors which measure key performance parameters at a selected site; (2) a Site Data Acquisition Subsystem (SDAS); (3) telephone transmission circuits; and (4) a Central Data Processing System (CDES). Sensor data are collected and stored on a cassette tape in the SDAS. For the majority of parameters, raw data are collected approximately every five minutes. Solar insolation and certain other parameters, which are subject to rapid variance, are sampled every 32 seconds. Environmental information collected at the sites for the reporting month are presented. The data include: insolation, temperatures, wind, and humidity. DOE

ORGANIC MATERIAL EMISSIONS FROM HOLDING PONDS AT COAL-FIRED POWER GENERATION FACILITIES Final Report

A. E. Rosecrance and B. N. Colby Mar. 1980 80 p refs
(EPRI-EA-1377; TPS-78-826) Avail: NTIS HC A05/MF A01

A literature survey of organic chemical emissions from holding or ash ponds which are used by most coal fired utilities to collect process waste materials was conducted. Approximately 140 Kg/day of organic material is predicted to be present in surface runoff of a hypothetical 1000 MW facility of which only 3.5 Kg/day or 2.6% of the total, is accounted for by specific compounds. Of the compounds identified, only phenol is near a level (97 microngram/1) of potential environmental significance. A survey of known holding pond influents was undertaken to assess which processes were most likely to be associated with the organic chemical content of the pond. Of the process wastes directed into the pond, cooling tower blowdown, water treatment wastes and boiler blowdown are identified as the major contributors of organic material. Organic chemical additives, which are used to control bacterial buildup, scale formation, pitting, corrosion, pH stability, and solid dispersion, account for approximately 96% of the organic pond influents. DOE

ENVIRONMENTAL ASSESSMENT. ENERGY EFFICIENCY STANDARDS FOR CONSUMER PRODUCTS Technical Support Document

Jun. 1980 137 p refs
(DOE/CS-0168; TSD-2) Avail: NTIS HC A07/MF A01

The Consumer Products Efficiency Standards (CPES) program covers: refrigerators and refrigerator-freezers, freezers, clothes dryers, water heaters, room air conditioners, home heating equipment, kitchen ranges and ovens, central air conditioners (cooling and heat pumps), furnaces, dishwashers, television sets, clothes washers, and humidifiers and dehumidifers. DOE proposed standards for eight of the products covered by the Program in a Notice of Proposed Rulemaking. DOE expects to propose standards for home heating equipment, central air conditioners (heat pumps only), dishwashers, television sets, clothes washers, and humidifiers and dehumidifiers in 1981. No significant adverse environmental or socioeconomic impacts were found to result from instituting the CPES. DOE

ENVIRONMENTAL-CONTROL-TECHNOLOGY ACTIVITIES OF THE DEPARTMENT OF ENERGY IN FY 1979

Jun. 1980 99 p refs
(DOE/EV-0084) Avail: NTIS HC A05/MF A01

Background material that contributes to the capability to evaluate and assess the environmental control accomplishments, issues, gaps, and overlaps associated with energy development within DOE, in conjunction with other agencies, and in the private sector is presented. A measure of the change in emphasis in the environmental control technology activities within DOE is also presented, indicating shifts, if any, in funding levels for each of the energy technologies. Total DOE FY 1979 budget outlay allocated to environmental control activities was $421,533,000 or 5.0% of the total FY 1979 DOE budget. The inputs received from the energy technology areas are summarized. These inputs were submitted in accordance with a description of environmental control related activities, which are those activities directed at research, development, and demonstration of processes, procedures, systems, subsystems, and strategies that directly or indirectly eliminate, minimize, or mitigate environmental impacts. INVENTORY OF EMISSIONS FROM NON-AUTOMOTIVE VEHICULAR SOURCES Final Report

H. J. Taback, J. F. Macko, N. R. Parker, D. A. Dale, and S. Erlich Feb. 1980 224 p refs
(Contract ARB-A7-167-30)
(PB80-182942; KVB-13-5808-1215; ARB-80/109) Avail: NTIS HC A10/MF A01 CSCL 13B

Methodologies for the inventory of emissions from nonautomotive vehicular sources are presented which are applicable in all areas of California. An inventory is compiled consisting of emissions for 1977 for the four counties comprising the South Coast Air Basin. Nonautomotive vehicular sources are defined as construction equipment, farm vehicles, industrial vehicles, and small boats. The general approach is to determine total annual fuel consumption by vehicle type, then multiply each total by the appropriate EPA emission factors. GRA

INCENTIVES FOR TECHNOLOGICAL INNOVATION IN AIR POLLUTION REDUCTION: AN ETIP (EXPERIMENTAL TECHNOLOGY INCENTIVES PROGRAM) POLICY RESEARCH SERIES. VOLUME 2. MARKET MECHANISMS FOR EMISSION REGULATION AND ENFORCEMENT OF EMISSION LIMITS: DETERRENCE AND DEMAND

William H. Foskett May 1980 32 p refs
(PB80-186083; NBS-GCR-ETIP-80-87-Vol-2) Avail: NTIS
HC A03/MF A01 CSCL 13B

Both trading and direct pricing types of market mechanisms for stationary source emission reduction are discussed. Even enforcement of individual source emission limits and the degree to which the private sector will organize and invest in the research and development work underlying technological innovation in air pollution control are included. Present enforcement inconsistencies, such as those among regional offices, and remedial actions are noted. If an EPA effort to strengthen detection of violations can be successfully implemented, its effect on a regulatee's perceived probability of getting caught could contribute to market participation. If the probability of detection and penalty is high, purchase of emission reductions on the market may be a more appealing alternative to regulatees than evasion or litigation. GRA

ECONOMIC IMPACT OF SULFUR DIOXIDE AND PARTICULATE MATTER REGULATIONS IN ILLINOIS Final Report
Alan S. Cohen Oct. 1979 133 p refs Sponsored by Illinois Inst. of Natural Resources
(PB80-182645; IINR-79/22; R77-15) Avail: NTIS
HC A07/MF A01 CSCL 13B

This document outlines the procedures used in preparing a benefit/cost analysis of the sulfur dioxide and particulate matter regulations listed below and describes the results indicated by the analysis. Reevaluation of rules 204 (c) (1) (A) and 203 (g) (1); deletion of rule 204 (c) (1) (D) previously designated 204 (c) (1) (B) (II); proposal by Ashland Chemical Company to amend rule 204 (c) (1) (A); and proposal by the City of Rochelle to amend rule 203 (g) (1). The purpose of the study is to satisfy the economic impact statement requirements of Illinois Public Act 79-790. Also the report can be viewed as four separate economic impact statements. Each economic impact statement consists of sections 1,2, and the appropriate subsection of section 3. Readers only intersted in a subset of the regulations analyzed will find the documentation of each regulation self sufficient. DOE

SAMPLING AND ANALYSIS OF REDUCED AND OXIDIZED SPECIES IN PROCESS STREAMS Final Report, Jul. 1976 - Aug. 1979
R. F. Maddalone, L. L. Scinto, and M. M. Yamada Nov. 1979 229 p refs
(Contract EPA-68-02-2165)
(PB80-191281; EPA-600/2-79-201) Avail: NTIS
HC A11/MF A01 CSCL 07D

Results of a program of over 60 tasks involving the evaluation, development, testing, and field adaptation of measurement techniques for elemental analysis and inorganic compound identification in process and effluent streams are given. Procedure for particulate sampling at the inlet and outlet of FGD systems were developed. Methods for H2SO4 sampling in flue gas streams were developed based on the controlled condensation of H2SO4 vapor. Two procedure manuals were written for reduced and oxidized inorganic species. The procedures developed showed that the analysis scheme is applicable to most solid samples from combustion sources. Ion chromatographic procedures were also developed for analyzing FGD system slurry streams. GRA

THE OCCURRENCE AND BEHAVIOR OF HALOMETHANES IN THE AQUATIC ENVIRONMENT Project Completion Report, 1 Oct. 1978 - 30 Jun. 1980
Frank M. Ditri and Swiatoslav W. Kaczmar Apr. 1980 134 p refs
(Contract DI-14-34-0001-9024)
(PB80-190317; W80-05407; OWRT-A-100-MICH(1)) Avail: NTIS HC A07/MF A01 CSCL 07D

The Red Cedar River was sampled and analyzed for halomethanes produced during the chlorination of wastewater that was discharged into the river. The development of a sewage tracer was investigated to provide a means to differentiate changes in haloform levels in the river due to dilution from those occurring as a result of volatization or adsorption. The methods researched were neutron activation analysis of europium, dysprosium and bromine, as well as a fluoresence and chloride ion tracer. The neutron activation methods were the most sensitive. Laboratory controlled haloform/oxygen gas transfer and adsorption experiments were conducted to predict the persistence of haloforms in a river system. Oxygen to haloform gas transfer ratios and a measured log sediment water partition coefficient were used to calculate Red Cedar River haloform volatization half lives. GRA

SORPTION PROPERTIES OF SEDIMENTS AND ENERGY-RELATED POLLUTANTS Final Report, Jul. 1977 - Dec. 1979
John J. Hassett, Jay C. Means, Wayne L. Banwart, and Susanne G. Wood Apr. 1980 50 p refs Prepared in cooperation with Maryland Univ., Solomons
(Contract EPA-68-03-2555)
(PB80-189574; EPA-600/3-80-041) Avail: NTIS
HC A03/MF A01 CSCL 07D

The factors that determine the extent of sorption of organic compounds that are representative of coal conversion waste streams are described. The compounds, all radiolabeled, were acetophenone; 1-naphthol; pyrene; 7,12-dimethylbenz(a) anthracene; 3-methylcholanthrene; dibenz(a,h)anthracene; acridine; 2,2'-biquinoline; 13H-dibenzo(a,i)carbazole; dibenzothiophene; benzidine; 2-aminoanthracene; 6-aminochrysene; and anthracene-9-carboxylic acid. Batch equilibrium isotherms were determined for each compound on 14 sediments and soils that had been collected from the Missouri, Illinois, Mississippi, and Ohio rivers and their watersheds. Laboratory procedures for determining octanol water partition coefficients and water solubilities were developed and then performed on the compounds. The sorption constants were correlated with soil and sediment properties and with the water solubilities and octanol water partition coefficients of the compounds. GRA

SULFUR DIOXIDE OXIDATION IN SCRUBBER SYSTEMS Final Report, Jul. 1977 - Jun. 1979
J. L. Hudson Apr. 1980 257 p refs
(Contract EPA-R-805227)
(PB80-187842; EPA-600/7-80-083) Avail: NTIS HC A12/MF A01 CSCL 07D

The liquid phase oxidation kinetics of bisulfite and sulfite anions (determined in bench scale experiments) to conditions representative of limestone scrubbers used for the flue gas desulfurization is detailed. The chemical reaction rates were determined for clear solutions and slurries of calcium sulfite when gas to liquid transfer of oxygen was not a limiting resistance. A mathematical model was developed for the overall oxidation rate of calcium sulfite slurries, including solids dissolution and chemical reaction. The overall rate is shown to decline with increasing pH. The homogeneous chemical oxidation rate is 1.5 order and increases with pH. GRA

PERFORMANCE OF SIMPLE MODELS FOR STACK PLUME DISPERSION DURING CONVECTIVE CONDITIONS Final Report
Jeffrey C. Weil Apr. 1980 45 p refs
(PB80-191869; PPSP-MP-30) Avail: NTIS HC A03/MF A01 CSCL 04A

Tests of two simple approaches for predicting ground-level concentrations during unstable conditions, the Gaussian plume and the Venkatram models, are presented. The Gaussian model was chosen because of its widespread use and the controversy surrounding the choice of dispersion parameters used in it. The Pasquill-Gifford A and B stability classes and the Brookhaven National Laboratory B2 Class were tested. The Venkatram model is based on recent theoretical ideas concerning the structure of the convectively mixed layer and dispersion of pollutants within it. GRA

EFFICIENT ALGORITHMS FOR SOLVING SYSTEMS OF ORDINARY DIFFERENTIAL EQUATIONS FOR ECOSYSTEM MODELING Final Report, Jul. 1977 - Aug. 1978
John Malanchuk, John Otis, and Hubert Bouver Mar. 1980 157 p refs Prepared in cooperation with Applied Physics Lab., Laurel, Md.
(Grant EPA-R-805452)
(PB80-190986; EPA-600/3-80-037) Avail: NTIS HC A08/MF A01 CSCL 06E

Three packages of subroutines for the numerical solution of systems of first order ordinary differential equations are presented. The three integration methods were chosen to provide an efficient means of solving the full range of initial value problems encountered in basin ecosystem modeling. The subroutines have been designed to handle all aspects of the numerical integration as automatically as possible so that their successful use does not require a sophisticated knowledge of the techniques of numerical analysis. After general introduction to the principles and concepts of numerical integration, the particular methods used in the codes are discussed in some detail. Full instructions for use are given, and some simple examples are presented. GRA

SEDIMENT BACTERIA AS A WATER QUALITY INDICATOR IN THE LYNNHAVEN ESTUARY
Carl W. Erkenbrecher, Jr. Jun. 1980 125 p refs Prepared in cooperation with Old Dominion Univ., Norfolk
(PB80-192354; VPI-VWRRC-BULL-126; W80-05467; OWRT-A-080-Va-1) Avail: NTIS HC A06/MF A01 CSCL 06F

The sediment throughout the estuary had a broad range in total coliforms, fecal coliforms, and fecal streptococci. The densities of benthic indicator bacteria, when expressed on a volumetric basis, were significantly greater than counts in the overlying waters. These counts were indicative of a fecally polluted system. Based on calculated fecal coliform to fecal streptococci ratios, the primary sources of the Lynnhaven's bacterial pollution appeared to be typical of urban and agricultural runoff. The sediments in the Lynnhaven serve as a reservoir for indicator bacteria in densities sufficient to pose potential health hazards. Disturbance in the uppermost sediment layer could cause the resuspension of existing fecal pollution. The results of this study show the urgent need to study more closely the significance of disease causing bacteria in sediments characterized by high levels of fecal pollution. GRA

Aerated treatment lagoons are used throughout the United States to provide secondary treatment of municipal wastewaters. The data available to assess the performance of these systems are lacking partially as a result of the infrequent sampling and limited types of analyses performed. Evaluation of the performance of a well designed, three cell aerated lagoon system over a twelve month period is discussed. The Consolidated Koshkonong Sanitary District's treatment system in Wisconsin is subject to a climate with large seasonal variations. The treatment system performed well in removing BOD5 and total suspended solids as well as producing an effluent with acceptable pH and coliform counts. GRA

ROCK FILTERS FOR REMOVAL OF ALGAE FROM LAGOON EFFLUENTS Final Report, 1977 - 1978
Gregory R. Swanson and Kenneth J. Williamson Mar. 1980 93 p refs
(Grant EPA-R-805416)
(PB80-190077; EPA-600/2-80-038) Avail: NTIS
HC A05/MF A01 CSCL 13B

Rock filtration was shown to be an effective, low cost unit process for removing algae from lagoon effluents and correspondingly upgrading lagoon treatment. Sedimentation is the primary mechanism of algal removal within rock filter. The settling rates of three species of algae common to lagoons were measured as varying from 0.02 to 0.3 m/day, depending on species and temperature. A mathematical model of the sedimentation mechanism was constructed based on discrete settling theory. A full scale horizontal flow operating rock filter designed for a maximum hydraulic loading of 0.28 cu m/cu m was evaluated. GRA

EFFECTS OF GASOHOL ON IDLE HC AND CO EMISSIONS
Thomas Darlington and Richard Lawrence Mar. 1980 19 p refs
(PB80-190655; EPA-AA-IMS/ST-80-4; TEB-80-13) Avail: NTIS HC A02/MF A01 CSCL 13B

A test program was run to investigate the effects of gasohol on CO and HC emissions on an I/M idle test. Three vehicles were set up to operate on either gasoline or gasohol. A Hamilton emissions analyzer was used to measure tailpipe emissions. CO emissions were varied in each of the cars by adjusting the idle mixture screw, and HC emissions were varied by inducing a misfire with a misfire generator. At each CO and HC value as specified in the program, the fuel was switched from gasoline to gasohol while its effect was noted on tailpipe emissions. The data obtained provided a basis for determining gasohol's ability to reduce CO and HC emissions for an idle test. GRA

Modifications to a computer model of electrostatic precipitation (ESP) are described. The modifications include a new semi-empirical approximation procedure for predicting electrical conditions in an ESP. Comparisons between the results from the approximation procedure and more exact procedures are presented. A new integration procedure for calculating particle charge is also presented. Complete FORTRAN listings for the revised ESP model and the new subprograms are provided. Example problems are included. The modified model requires significantly less computer time than does the earlier model. Comparisons of results obtained using the earlier and the modified models over a wide range of possible ESP geometries and electrical operating points indicate that for practical purposes the modified model can be used in place of the more rigorous earlier model. The Emission Offset Interpretative Ruling is analyzed into its administrative components. Eight permit applications involving emission offsets provide data describing the administrative functioning of the offset policy in terms of these components. Offsets were easy to find, but the process for determining lowest achievable emission reduction was complex. Third parties promoting local economic development were an important factor in locating offsets. Technological innovation involved development of new control techniques and diffusion of known technology to uncontrolled sources of emissions. GRA

POTENTIAL COEFFICIENT AND ANOMALY DEGREE VARIANCE MODELLING REVISITED
Richard H. Rapp. Sep. 1979. 23 p. refs.
(Contract F19628-79-C-0027)
(AD-A082322; AFGL-TR-79-0245; SR-2) Avail: NTIS. HC A02/MF A01. CSCL 08/14.

The decay of the power spectrum of the Earth's gravitational potential was modeled using the GEM 10B solution of NASA and a solution complete to degree 180 at OSU. The modelling was first done using the form of A/lambda sub B where A and B were parameters determined by various adjustment techniques. For degrees through 36, the best estimate of A is 10.6 x 10 to the -6 power and B = 2.17 based on the GEM 10B data. Earlier models by Kaula and Tscherning/Rapp contain too much power as compared to the actual field beyond degree 8. Anomaly degree variance models were also computed from the anomaly degree variances of the 180 solution and other data such as a point anomaly variance, and a horizontal gradient variance. With this data, it was found that the parameters of the earlier Tscherning/Rapp model are still valid provided a high gradient variance is acceptable. Excellent fit to all data types is obtained with the two component model suggested by Moritz. All models used are compared in terms of common parameters such as point anomaly variance, gradient variance, undulation variance and fits to observed potential coefficient variations. A.R.H.

Fracture mechanics is used to develop a theory of earthquake mechanism which includes the phenomenon of subcritical crack growth. The following phenomena are predicted: slow earthquakes, multiple events, delayed multiple events (doublets), postseismic rupture growth and afterslip, foreshocks, and aftershocks. The theory predicts a nucleation stage prior to an earthquake, and suggests a physical mechanism by which one earthquake may 'trigger' another. S.F.

IONOSPHERIC F-REGION RESPONSE TO GEOMAGNETIC STORMS, OVER BRAZILIAN LOW LATITUDE
M. A. Abdu, I. J. Kantor, E. R. DePaula, and A. C. Giese. Jul. 1980. 21 p. refs. Presented at the 32d Ann. Meeting of SBPC. Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico.
(INPE-1835-RPE/197) Avail: NTIS. HC A02/MF A01.

Ionosonde data from Cachoeira Paulista are analyzed to study the response of the ionospheric F region electron densities and heights to magnetic storm disturbances of moderate to strong intensity. The ionospheric response was found to be highly variable from one storm to another, depending upon the intensity, duration and the definitions of the different phases of the magnetic storm. Certain characteristics of the ionospheric response over Cachoeira Paulista are: in general, the ionosphere appears relatively more disturbed during the night than during the day; during the main phase of the magnetic storm, the F region maximum electron density generally presents significant enhancements; and significant depletion in the ionization occurs during the recovery phase of the storm. The changes in the height of the layer are not well defined, except in rare cases when it shows variations in opposite sense to that of the electron density. These results are interpreted in terms of the extension, to low latitude, of the storm induced midlatitude thermospheric disturbances in composition and transport. R.K.G.

WAVE DISTURBANCES IN THE LOW LATITUDE IONOSPHERE AND EQUATORIAL IONOSPHERE PLASMA DEPLETIONS
J. H. A. Sobral, M. A. Abdu, I. S. Batista, and C. J. Zamlutti. Jun. 1980. 16 p. refs. Presented at the 32d Ann. Meeting of the SBPC, Jul. 1980. Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico.
(INPE-1806-RPE/174) Avail: NTIS. HC A02/MF A01.

An isolated nighttime ionospheric wave disturbance was observed by a meridional scanning 6300 a photometer, a 6300 a zenith photometer, a 30 MHz ionometer and an ionosonde. Two different scale size for the disturbances are: a larger scale component easily identified in the ionometer data similar to those of a large scale TID and smaller scale disturbance observable in the scanning photometer data, occurring during the ascending phases of the larger scale waves. A Fourier analysis of the zenith airglow variations reveals a dominant period of about 104 minutes. No single dominant period is presented for the smaller scale waves. All waves have a poleward velocity component; the smaller scale waves show this feature more markedly. The equatorial source of the smaller scale disturbance suggests that these are perhaps the low altitude manifestations of the upward propagating field aligned plasma bubbles in the equatorial ionosphere. S.F.

GRAVITY WAVE INDUCED IONIZATION LAYERS IN THE NIGHT F-REGION AT LOW LATITUDES
M. A. Abdu, I. S. Batista, I. J. Kantor, and J. H. A. Sobral Jun. 1980 21 p refs Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1759-RPE/148) Avail: NTIS HC A02/MF A01

Ionosone observations over Cachoeira Paulista (22 S, 45 W) a low latitude station, show distorted h prime (f) traces in the ionograms due to passage of TID's. The disortions of the traces, at times take the form of an F-region bifurcated into two distinct layers. These effects are observed mostly during presunrise hours. The characteristics of the electron density and height oscillations suggest either presence of low energy (< 10 KeV) electron precipitation in the South Atlantic Geomagnetic Anomaly and/or ionization convergence due to horizontal shears in the gravity wave producting the TID's. SOME CHARACTERISTICS OF SPREAD F AT MAGNETIC EQUATORIAL STATION FORTALEZA
M. A. Abdu, I. S. Batista, and J. A. Bittencourt Jun. 1980 20 p refs Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Tecnologico
(INPE-1758-RPE/147) Avail: NTIS HC A02/MF A01

Spread F in ionograms of both the range and frequency spread types is studied for the magnetic equatorial station Fortaleza (38 degrees W, 3 degrees S) for a one year period during 1978-79. The TID type disturbances in the evening equatorial ionosphere are found to be a necessary prerequisite for the generation of the instabilities giving rise to the range type spread F, whereas frequency type spread F is formed under different circumstances. Striking differences are noted in the spread F characteristics and related parameters over Fortaleza as compared to Huancayo and Jicamarca, situated within only 38 degrees in longitude west of Fortaleza. The post sunset maximum in winter is delayed by about one and a half hours with respect to other seasons over Fortaleza, as compared to Huancayo, where it occurs earlier in winter than in other seasons. Similar differences exist also in the prereversal peak near sunset in the vertical drift velocity (Vz) between Fortaleza and Jicamarca. S.F.

N80-33031# Instituto de Pesquisas Especiais, Sao Jose dos Campos (Brazil).
SEASONAL VARIATION OF OZONE IN THE MESOSPHERE
V. W. J. H. Kirchhoff, B. R. Clemesha, and D. M. Simonich Jun. 1980 18 p refs Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1800-RPE/170) Avail: NTIS HC A02/MF A01

The mesospheric ozone density at a height of 88 km was deduced from simultaneous ground based observations of neutral sodium density and sodium nightglow intensity, using a photochemical equilibrium model. Sodium densities were measured as a function of height between 76 and 106 km by laser radar, and the nightglow intensities by a tilting filter photometer. The ozone density shows a strong seasonal variation with well defined maxima at the equinoxes, and a mean annual value of 8 X 10 to the 7th power/cubic centimeter. The average nocturnal variation shows a factor of 2 increase between sunset and sunrise. S.F.

SIMULTANEOUS MEASUREMENTS OF OH(9,4), (8,3), (7,2), (6,2) AND (5,1) BANDS IN THE AIRGLOW
H. Takahashi and P. P. Batista Jun. 1980 39 p refs Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1801-RPE/171) Avail: NTIS HC A03/MF A01

Band intensities and the rotational temperatures for the OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands were measured by means of a multichannel tilting filter photometer at Cachoeira Paulista, Brazil. The nocturnal variations of the five bands show good correlation between them, but there are small differences in the amplitudes of the variations between the bands from the upper vibrational levels and those from the lower levels. The cross correlation between the band intensities show that the nocturnal variations of the upper vibrational bands lead those of the lower levels. Vibrational population rates and initial excitation rates for each vibrational level are calculated. An increase of the initial excitation rate in the v = 5 and v = 6 levels was observed. The different features of the intensity variations and the excitation rates of the lower vibrational levels suggest the existence of the mechanism HO2 + O yields OH + O2, capable of exciting OH to the v = 5 and v = 6 levels, in addition to the principal mechanism, assumed to be the reaction H + O3 yields OH + O2. R.K.G.

REGIONAL ANALYSIS OF EARTHQUAKE OCCURRENCE AND SEISMIC ENERGY RELEASE
S. C. Cohen Aug. 1980 16 p refs Submitted for publication
(NASA-TM-81994) Avail: NTIS HC A02/MF A01 CSCL 08K

The historic temporal variation in earthquake occurrence and seismic energy release on a regional basis throughout the world were studied. The regionalization scheme employed divided the world into large areas based either on seismic and tectonic considerations (Flinn-Engdahl Scheme) or geographic (longitude and latitude) criteria. The data set is the wide earthquake catalog of the National Geophysical Solar-Terrestrial Data Center. An apparent relationship exists between the maximum energy released in a limited time within a seismic region and the average or background energy per year averaged over a long time period. In terms of average or peak energy release, the most seismic regions of the world during the 50 to 81 year period ending in 1977 were Japanese, Andean South American, and the Alaska-Aleutian Arc regions. The year to year fluctuations in regional seismic energy release are greater, by orders of magnitude, than the corresponding variations in the world-wide seismic energy release. The b values of seismic regions range from 0.7 to 1.4 where earthquake magnitude is in the range 6.0 to 7.5. T.M.

INTERPRETATION OF DATA FROM UPHOLE REFRACTION SURVEYS Final Report
Arley G. Franklin Jun. 1980 73 p refs
(AD-A087775; WES/MP/GL-80-5) Avail: NTIS
HC A04/MF A01 CSCL 17/10

The conventional interpretation of the data from an uphole refraction survey is based on the similarity between a plot of contours drawn on uphole arrival times and a wave-front diagram, which shows successive positions of the wave front produced by a single shot location at the ground surface. However, the two are alike only when the ground consists solely of homogeneous strata, oriented either horizontally or vertically. In this report, the term 'Meissner diagram' is used for the plot of arrival times from the uphole refraction survey in order to maintain the distinction between it and a true wave-front diagram. Where departures from the case of homogeneous, horizontal strata exist, the interpretation of the Meissner diagram is not straightforward, although a partial interpretation in terms of a horizontally stratified system is usually possible. A systematic approach to the interpretation problem, making use of such a partial interpretation, is proposed. GRA

ION PRODUCTION IN THE D-REGION Interim Report
William Swider 14 May 1980 20 p refs
(AF Proj. 2310)
(AD-A085533; AFGL-TR-80-0156) Avail: NTIS
HC A02/MF A01 CSCL 04/1

Ionization processes for the D region are reviewed. Levels of ionization range from the fairly steady rates produced through galactic cosmic rays to the large rates generated during solar flares and associated geomagnetic storms. The normal quiescent daytime D region is ionized by solar UV radiation available because of certain windows and solar X-rays, although this latter source is generally weak. Cosmic rays are important roughly below 65 km. At night, stellar X-ray sources may be important along with precipitating electrons at high latitudes from the magnetosphere. Solar flares can result in ionization rates due to X-rays, electrons or nuclei which are greatly enhanced over quiet conditions. Typical ionization production rates from these various sources are illustrated. J.M.S.

Avail: NTIS HC A03/MF A01 CSCL 04/1

Results of the Rice University substorm simulation have been used to investigate the penetration of substorm-associated electric fields into the plasmasphere. Near 4 R(E) in the equatorial plane, our time-dependent electric field model is characterized by eastward components in the dusk-midnight local time sector and westward components after midnight. Except for a small region just before dusk the model predicts eastward electric field components throughout the daytime sector. The characteristic radial component is directed inward at all local times except for a small region just after dawn. These results compare favorably with available whistler and incoherent scatter measurements obtained during magnetically disturbed periods. By assuming an initial plasmapause shape and by following the computed E x B drift trajectories of plasma flux tubes from that initial boundary we have examined the short-term evolution of the plasmapause during the substorm-like event of 19 September 1976. We find that narrow filamentary tails can be drawn out from the plasmasphere near dusk within hours of substorm onset. These tail-like appendages to the plasmasphere subsequently drift rapidly from the dust sector toward the daytime magnetopause. Investigation of the large-scale time-dependent flow of plasma in the evening sector indicates that some mid-latitude plasma flux tubes that drift eastward past the dusk terminator reverse their motion between dusk and midnight and begin to drift westward toward dusk. Such time-dependent changes in flow trajectories may be related to the formation of F-region ionization troughs. GRA

This report describes a computer code for predicting atmospheric transmittance and the thermal radiation emitted by the atmosphere and Earth from 350 to 40,000 per cm at a spectral resolution of 20 per cm. The program is based on the LOWTRAN 4 (1978) computer code. New altitude and relative humidity dependent aerosol models and new fog models are included in the code. In addition, the new code structure consists of a main program and 19 subroutines. The computer code contains representative (geographical and seasonal) atmospheric models and representative aerosol models with an option to replace them with user derived or measured values. The program can be run in one of two modes, namely, to compute only atmospheric transmittance or both atmospheric transmittance and radiance for any given slant path geometry. GRA

GEOMAGNETIC INDEX CALCULATION AND USE AT AFGWC
Robert D. Prochaska Apr. 1980 34 p refs
(AD-A088234; AFGWC/TN-80/002) Avail: NTIS HC A03/MF A01 CSCL 08/14

At Air Force Global Weather Central (AFGWC) several geomagnetic indices to specify the state of the magnetosphere were used. In this paper it introduces the indices of geomagnetic activity most commonly in use by DOD agencies. It discusses the procedures used at AFGCW to compute the indices and briefly describes the uses of each one. GRA

AIRBORNE MEASUREMENTS OF STRATOSPHERIC OZONE INTRUSIONS INTO THE TROPOSPHERE OVER THE UNITED STATES. VOLUME 1: DATA ANALYSIS AND INTERPRETATION Final Report
William Viezee, Warren B. Johnson, and Hanwant B. Singh Sep. 1979 142 p refs
(SRI Proj. 6690)
(PB80-185788; CRC-APRAC-CAPA-15-76A-Vol-1) Avail: NTIS HC A07/MF A01 CSCL 04A

The magnitude, variability, and sources of natural ozone occurring in rural locations, both at the ground and aloft were investigated. Two field programs using an instrumented aircraft were carried out to investigate the downward vertical transport of ozone rich air from the stratosphere as a potential cause of natural tropospheric ozone. The field programs are described and the analysis and interpretation of the collected data are presented. GRA

AN ATLAS OF 1977 AND 1978 GEOS-3 RADAR ALTIMETER DATA FOR TROPICAL CYCLONE STUDIES
H. Ray Stanley (EG and G Washington Analytical Services Center, Inc., Pocomoke City, Md.) and Ronald L. Taylor Aug. 1980 229 p refs
(Contract NAS6-2639)
(NASA-TM-73288) Avail: NTIS HC A11/MF A01 CSCL 04B

All of the GEOS 3 satellite altimeter schedule information were collected with all of the available 1977 and 1978 tropical cyclone positional information. The time period covers from March 23, 1977 through Nov. 23, 1978. The geographical region includes all ocean area north of the equator divided into the following operational areas: the Atlantic area (which includes the Caribbean and Gulf of Mexico); the eastern Pacific area; the central and western Pacific area; and the Indian Ocean area. All available source material concerning tropical cyclones was collected. The date/time/location information was extracted for each disturbance. This information was compared with the GEOS 3 altimeter ON/OFF history information to determine the existence of any altimeter data close enough in both time and location to make the data potentially useful for further study (the very liberal criteria used was time less than 24 hours and location within 25 degrees). Geographic plots (cyclone versus GEOS 3 orbit track) were produced for all of the events found showing the approximate location of the cyclone and the GEOS 3 orbit traces for the full day. T.M.

A 94/183 GHz MULTICHANNEL RADIOMETER FOR CONVAIR FLIGHTS Final Technical Report, 6 Apr. 1978 - 2 Feb. 1979
J. A. Gagliano, J. A. Stratigos, R. E. Forsythe, and J. M. Schuchardt Jan. 1979 243 p
(Contract NAS5-24480)
(NASA-CR-160032) Avail: NTIS HC A11/MF A01 CSCL 14B

A multichannel 94/183 GHz radiometer was designed, built, and installed on the NASA Convair 990 research aircraft to take data for hurricane penetration flights, SEASAT-A underflights for measuring rain and water vapor, and Nimbus-G underflights for new sea ice signatures and sea surface temperature data (94 GHz only). The radiometer utilized IF frequencies of 1, 5, and 8.75 GHz about the peak of the atmospheric water vapor absorption line, centered at 183.3 GHz, to gather data needed to determine the shape of the water molecule line. Another portion of the radiometer operated at 94 GHz and obtained data on the sea brightness temperature, sea ice signatures, and on areas of rain near the ocean surface. The radiometer used a multiple lens antenna/temperature calibration technique using 3 lenses and corrugated feed horns at 94 GHz and 183 GHz. Alignment of the feed beams at 94 GHz and 183 GHz was accomplished using a 45 deg oriented reflecting surface which permitted simultaneous viewing of the feeds on alternate cycles of the chopping intervals. STEPWISE LINEAR REGRESSION EXPERIMENTS IN 14- AND 19-DAY HEMISPHERIC WEATHER PREDICTION
S. Srivatsangam Jun. 1980 9 p refs Presented at the Intern. Symp. on Statist. and Probabilistic Weather Prediction, Nice, 8-12 Sep. 1980

(Contract N00228-76-C-3205)
(INPE-1757-RPE/146) Avail: NTIS HC A02/MF A01

The zonal variance of the heights of constant pressure surfaces in the atmosphere is taken to be Markovian, i.e., unpredictable over long times by its own history. It is shown through cross correlation and multiple regression that the zonal variance is predictable over long times at a given location, through its lagged cross correlation at other locations. A CLIMATOLOGICAL STUDY OF THE TROPOSPHERIC CIRCULATION OVER THE AMAZON REGION
Vernon E. Kousky and Mary T. Kagano Jun. 1980 37 p refs Submitted for publication
(INPE-1761-RPE/150) Avail: NTIS HC A03/MF A01

Climatological and monthly means are computed for radiosonde data at Manaus and Belem (1968-1976). Geopotential height and wind data at upper levels show evidence of the meridional movement of a strongly divergent high pressure system associated with the area of maximum convection. At low levels, the winds, particularly at Manaus, show an annual cycle linked to the meridional displacement of the equatorial trough and its accompanying area of maximum convection (upper level high pressure system). On the average, the precipitable water (Pw) is greater at Manaus than at Belem. Evidence is presented indicating that this is not always the case and that considerable diurnal variation in Pw exists at each station. Mean monthly vertical motions are calculated for the area within the triangle formed with Belem, Manaus and Vilhena as the vertices. These vertical motions show a strong relationship to monthly rainfall totals within the triangle indicating that interannual and monthly rainfall variations may be due to large scale atmospheric circulation changes. MESOSPHERIC WINDS FROM LIDAR OBSERVATIONS OF ATMOSPHERIC SODIUM
B. R. Clemesha, V. W. J. H. Kirchhoff, D. M. Simonich, and P. P. Batista Jun. 1980 14 p refs Submitted for publication Sponsored by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1811-RPE/179) Avail: NTIS HC A02/MF A01

Laser radar observations of the atmospheric sodium layer made by various groups of workers during the past decade show that the layer exhibits considerable time varying structure. Horizontally spaced measurements of this structure, and use of the results of these observations to derive horizontal velocities in the height range 82 to 99 km are described. The measurements were made with a steerable lidar operating at a fixed zenith angle of 20.9 deg and pointed at each of three azimuths in turn, the complete sequence taking five minutes. The azimuths were chosen such that the intersections of the lidar beam with the sodium layer formed a triangle with approximately 60 km sides. The velocities calculated from the derived time shifts were found to vary with height in an oscillatory manner, with amplitude increasing with height. The E-W component showed a vertical wavelength of approximately 10 km, the N-S component a wavelength of 5 km, and the magnitude of the velocity varied between 6 and 146 m/sec. Author

VERTICAL VELOCITY FORCED BY TOPOGRAPHY IN THE SOUTHERN HEMISPHERE
Rubens Leite Vianello (Univ. Federal de Vicosa, Brazil) and V. Brahmananda Rao Mar. 1980 16 p refs Submitted for publication Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1691-RPE/119) Avail: NTIS HC A02/MF A01

Vertical component of wind forced topography in the Southern Hemisphere is calculated using the equation given by Saltzman and Irsch. The contributions of zonal deviations of wind and zonal mean are contained in the equation. The vertical velocity, forced by topography in the Southern Hemisphere is comparable to that in the Northern Hemisphere. In the Northern Hemisphere, the zonal deviations of wind contribute significantly to the vertical velocity. R.K.G.

RELATION BETWEEN WEST COASTAL RAINFALL AND NIMBUS-6 SCAMS LIQUID WATER DATA OVER THE NORTHEASTERN PACIFIC OCEAN Final Report, Mar. 1978 - Jan. 1979
W. Viezee and H. Shigeishi Jan. 1979 21 p refs Presented at the 4th NASA Weather and Climate Program Sci. Rev., Greenbelt, Md., 24-25 Jan. 1979
(Contract NAS5-24450)
(NASA-CR-160031; Rept-7273) Avail: NTIS HC A02/MF A01 CSCL 04B

The application to rainfall prediction of cloud liquid water data obtained from the SCAMS experiment of Nimbus-6 is explored. The study area is the Pacific Northwest coast of the United States, where rainfall is produced by extratropical storms that approach from across the Pacific Ocean. The SCAMS data related to cloud liquid water over the ocean, and coastal rainfall data, are analyzed for 20 different storm systems in the northeastern Pacific Ocean; these produced significant rainfall from Washington to central California during the period October 1975 through March 1976. Results show that the distribution of storm cloud water analyzed from the SCAMS data over the ocean foreshadows the distribution of coastal rainfall accumulated from the storm at a later time. It is concluded that passive microwave sensor measurements of cloud water over the ocean, when used in conjunction with numerical and other objective guidance, can be used to enhance the accuracy of predictions of coastal rainfall distribution. Limitations in the SCAMS measurements and in the data analysis and interpretation are noted. J.M.S.

MULTI-YEAR SLANT PATH RAIN FADE STATISTICS AT 28.56 AND 19.04 GHz FOR WALLOPS ISLAND, VIRGINIA
Julius Goldhirsh Dec. 1979 51 p refs
(NASA Order S-50748-A)
(NASA-CR-160027; APL/JHU-S1R79U-035) Avail: NTIS HC A04/MF A01 CSCL 04B

Multiyear rain fade statistics at 28.56 GHz and 19.04 GHz were compiled for the region of Wallops Island, Virginia covering

the time periods, 1 April 1977 through 31 March 1978, and 1 September 1978 through 31 August 1979. The 28.56 GHz attenuations were derived by monitoring the beacon signals from the COMSTAR geosynchronous satellite, D sub 2 during the first year, and satellite, D sub 3, during the second year. Although 19.04 GHz beacons exist aboard these satellites, statistics at this frequency were predicted using the 28 GHz fade data, the measured rain rate distribution, and effective path length concepts. The prediction method used was tested against radar derived fade distributions and excellent comparisons were noted. For example, the rms deviations between the predicted and test distributions were less than or equal to 0.2dB or 4% at 19.04 GHz. The average ratio between the 28.56 GHz and 19.04 GHz fades were also derived for equal percentages of time resulting in a factor of 2.1 with a .05 standard deviation.

WEATHER AND CLIMATE NEEDS FOR LIDAR OBSERVATIONS FROM SPACE AND CONCEPTS FOR THEIR REALIZATION
David Atlas and C. Lawrence Korb Jun. 1980 55 p refs Presented at the OSA Conf. on Coherent Laser Radar for Atmospheric Sensing, Aspen, Colo., 15-17 Jul. 1980 Submitted for publication
(NASA-TM-82006) Avail: NTIS HC A04/MF A01 CSCL 04B

The spectrum of weather and climate needs for Lidar observations from space is discussed with emphasis on the requirements for wind, temperature, moisture, and pressure data. It is shown that winds are required to realistically depict all atmospheric scales in the tropics and the smaller scales at higher latitudes, where both temperature and wind profiles are necessary. The need for means to estimate air-sea exchanges of sensible and latent heat also is noted. A concept for achieving this through a combination of Lidar cloud top heights and IR cloud top temperatures of cloud streets formed during cold air outbreaks over the warmer ocean is outlined. Recent theoretical feasibility studies concerning the profiling of temperatures, pressure, and humidity by differential absorption Lidar (DIAL) from space and expected accuracies are reviewed. An alternative approach to Doppler Lidar wind measurements also is presented. The concept involves the measurement of the displacement of the aerosol backscatter pattern, at constant heights, between two successive scans of the same area, one ahead of the spacecraft and the other behind it a few minutes later. Finally, an integrated space Lidar system capable of measuring temperature, pressure, humidity, and winds which combines the DIAL methods with the aerosol pattern displacement concept is described. J.M.S.

DEVELOPMENT OF TECHNIQUES TO SPECIFY CLOUDINESS AND RAINFALL RATE USING GOES IMAGERY DATA Final Report
Stuart H. Muench and Thomas J. Keegan Oct. 1979 46 p refs
(AF Proj. 6670)
(AD-A084757; AFGL-TR-79-0255; AFGL-ERP-687) Avail: NTIS HC A03/MF A01 CSCL 04/2

Methods of introducing digitized satellite imagery into short range, objective forecasting operations are presented. The data archive being assembled for this study is described, with particular attention given to the steps taken to maximize the accuracy of the satellite imagery. These steps included fine tuning the navigation and selecting procedures for normalizing the data by correcting for the effects of Lambertian and anisotropic scattering. Consistency of the data, spatial and temporal, was tested by analysis of ground reflectance during cloudless days, and a pilot test of the specification of single layers of clouds was conducted. Both of these tests gave envouraging results. An investigation of specifying precipitation rate, using just the visible reflectance and infrared temperature of the cloud top, also produced good results. Author

THE EFFECT OF THE WESTERN UNION WEATHER DATA SYSTEM ON THE PREFLIGHT BRIEFING POSITION AT THE CHICAGO FLIGHT SERVICE STATION Final Report, Aug. 1975 - May 1978
Ephraim Shochet, James D. Talotta, and Robert P. Holladay Jul. 1980 29 p ref
(AD-A088415; FAA-CT-79-55; FAA-RD-80-23) Avail: NTIS
HC A03/MF A01 CSCL 17/7

An experiment utilizing a 'before/after' research design was conducted to determine the effect of the Western Union Weather Data System (WDS) on the preflight briefing position at the Chicago, Illinois, Flight Service Station (FSS). Specialist activity was recorded by making written annotations on a moving paper chart called a kymograph. The average length of time spent in each activity prior to the installation of automated equipment was compared to the time spent in the same activity after automation. In addition, a questionnaire survey and personal interviews with specialists were conducted in the 'after' period. The data obtained from the specialist opinion survey indicate that the WDS improved the quality of flight information service to the user pilot and improved job satisfaction for the specialist. The objective data was congruent with and in the same direction as the data that was obtained from the specialist opinion survey. However, the specialists perceived a greater reduction in workload than was measured in the before and after comparison of preflight briefing times. GRA

THE MICROCLIMATE OF A TROPICAL EVERGREEN FOREST Preliminary Final Report, 15 Jul. 1976 - 31 Dec. 1979
R. T. Pinker and O. E. Thompson Aug. 1980 101 p refs
(Grant DAAG29-76-G-0292)
(AD-A088059; ARO-13660.4-GS) Avail: NTIS
HC A06/MF A01 CSCL 04/2

Selected results of a three year project to study the climatological and micrometeorological conditions in a tropical evergreen forest, are summarized in this report. The forest area under study is in the interior of Thailand and is influenced by a cool, dry northeast monsoonal flow in the winter and a warm, moist southwest monsoonal flow in the summer. Information collected during a three year field program included ground stations temperature, relative humidity, precipitation, evaporation, hours of sunshine and tower measurements of temperature, dew point temperature, wind velocity, incoming and reflected solar radiation, incoming and outgoing infrared radiation, spectral radiation and sub-surface temperature profiles in the forest and in a cleared area within the forest. NUMERICAL SIMULATION OF THE INFLUENCE OF SEA-SURFACE TEMPERATURE ON TRANSLATING TROPICAL CYCLONES Interim Report
Simon W. Chang and Rangarao V. Madala 17 Jul. 1980 46 p refs
(AD-A088050; NRL-MR-4272) Avail: NTIS
HC A03/MF A01 CSCL 04/2

A three dimensional numerical model with a domain of 3000 x 3000 km is used to study the influence of sea-surface temperature (SST) on the behavior of tropical cyclones translating with mean flows in the Northern Hemisphere. We find that tropical cyclones tend to move into regions of warmer SST when a gradient of SST is perpendicular to the mean ambient flow vector (MAFV). The model results also indicated that a region of warmer SST situated to the right side of the MAFV is more favorable for storm intensification than to the left side due to the asymmetries in air-sea energy exchanges associated with translating tropical cyclones. The model tropical cyclone intensifies and has greater rightward deflection in its path relative to the MAFV when translating into the region of warmer SST. The model tropical cyclone intensifies when its center travels along a warm strip, it weakens along, but does not move away from a cool strip. The results suggest that the SST distribution not only affects the intensity and path of tropical cyclones frictionally, but also affects them thermally through processes of heating redistribution and geostrophic adjustment. ATLAS OF CLOUD-FREE LINE-OF-SIGHT PROBABILITIES. PART 5: NORTH AFRICA AND THE MIDDLE EAST Interim Report

Iver A. Lund, Donald D. Grantham, Eugene A. Bertoni, and Clarence B. Elam, Jr. (Environmental Technical Applications Center, Scott AFB, Ill.) 9 Nov. 1979 67 p refs
(AF Proj. 6670)
(AD-A088156; AFGL-TR-79-0275-Pt-5; AFGL-AFSG-417)
Avail: NTIS HC A04/MF A01 CSCL 04/2

This is the fifth part of a planned Northern Hemisphere atlas of probabilities of cloud free lines-of-sight between the Earth and space. The probabilities are for the midseason months: January, April, July, and October; four times of day: 0000-0200 LST, 0600-0800 LST, 1200-1400 LST, and 1800-2000 LST; and three elevation angles: 10, 30 and 90 deg. Parts 1, 2, 3, and 4 depicted cloud free line-of-sight probabilities for Germany, the USSR, the USA, and Europe, respectively.

USE OF HELIUM-3 AS A GAS TRACER FOR MESO-SCALE METEOROLOGICAL STUDIES
J. E. Halverson, M. M. Pendergast, and A. L. Boni 1979 24 p refs Presented at the Atmospheric Tracer Workshop, Los Alamos, N. Mex., 23-24 May 1979
(Contract EY-76-C-09-0001)
(DP-MS-79-51) Avail: NTIS HC A02/MF A01

Plans to use He-3 as a tracer in atmospheric diffusion studies are outlined. A specially designed static gas mass spectrometer is used to measure He-3/He-4 abundance ratios in the atmospheric samples. Analysis of results of previous studies indicate that He-3 can be a useful tracer for plume releases at distances greater than 100 km.

COMPARISON OF ATMOSPHERIC TEMPERATURE STRUCTURE AT THE WALL AND IN THE MIDDLE OF A VALLEY
Sumner Barr, Williams E. Clements, and S. Kerry Wilson 1980 5 p refs Presented at the 2nd Joint Conf. on Appl. of Air Pollution Meteorol., Am. Meteorol. Soc., New Orleans, 24-27 Mar. 1980
(Contract W-7405-eng-36)
(LA-UR-80-792; CONF-800327-7) Avail: NTIS HC A02/MF A01

At Anderson Creek Valley in the Geysers area of California, temperatures on the valley wall were compared with temperature profiles in the middle of the valley. An ensemble of temperature measurements including vertical soundings and surface based measurements from fixed stations and a mobile unit were analyzed. Surface measurements at various altitudes in Anderson Creek Valley were as much as 10 C cooler than the temperature in mid valley at the same altitude. The departures were smallest in the early evening and grew during the night. The cold air was quite shallow and if care were taken to make ground based measurements on promontaries or towers, the gross stability could be characterized by surface temperature observations up the side of the valley. A more promising analysis of the data is to interpret the thermal gradients from the valley wall to the center in terms of the driving force they provide to the drainage flow.

DEFINITION OF GUST MODEL CONCEPT AND REVIEW OF GUST MODELS
David C. Powell and James R. Connell Jun. 1980 100 p refs
(Contract DE-AC06-76RL-01830)
(PNL-3138) Avail: NTIS HC A05/MF A01

Four models are examined which attempt to describe wind fluctuations in relation to a wind energy conversion system that is subjected to these fluctuations observed from a fixed location within the atmospheric boundary layer. The primary purpose of this examination is to provide a basis for understanding present and future developments in gust and gust rise models. The examination is accomplished by identifying the gust definitions used in the models and relating them to a basic definition given.

WIND CHARACTERISTICS PROGRAM ELEMENT Annual Report, Jul. 1978 - Sep. 1979
L. L. Wendell, W. R. Barchet, J. R. Connell, A. H. Miller, W. T. Pennell, and D. S. Renne May 1980 209 p refs
(Contract DE-AC06-76RL-01830)
(PNL-3211) Avail: NTIS HC A10/MF A01

As a service element within the Federal Wind Energy Program, the wind characteristics program element (WCPE) is established to provide the appropriate wind characteristics information to those involved in: the design and evaluation of wind energy conversion systems (WECS); energy program planning; selecting sites for WECS installation; and the operation of WECS. To effectively produce the information needed in these four categories, the WCPE, for which the Pacific Northwest Laboratory (PNL) has the responsibility for management and technical assistance, was divided into four technical program areas. During this reporting period PNL was also assigned the management responsibility for the data collection at the US Department of Energy's (DOE's) candidate sites, as well as the task of providing technical assistance to DOE evaluation and site selection panels for new candidate sites.

APPLICATION OF A PHOTODIODE-ARRAY OPTICAL TURBULENCE SENSOR TO WIND STUDIES IN COMPLEX TERRAIN
W. M. Porch and T. J. Green 1980 17 p refs Presented at ASCOT Program Planning Meeting, Gettysburg, Pa., 15 Apr. 1980
(Contract W-7405-eng-48)
(UCRL-84503; CONF-800480-3) Avail: NTIS HC A02/MF A01

A digital photodiode array optical turbulence sensor was used to gather data simultaneously with analog optical anemometer measurements during the July 1979 ASCOT experiment. This system provided useful information regarding the uniformity of optical turbulence used by the optical anemometer to drive cross path wind speeds. Wind speeds derived from digital analysis of the photodiode array intensities also provided an independent measure of the cross path wind speed. Close agreement was found between these two measures of the wind.

REMOTE ACOUSTIC SENSING OF OCEANIC FLUID AND BIOLOGICAL PROCESSES
M. H. Orr Jun. 1980 57 p refs Presented at the Ocean Acoustic Remote Sensing Workshop, Seattle, 21-25 Jan. 1980
(Contract N00014-77-C-0196; Grants NOAA-NA79-AA-D-00030; NOAA-NA79-AA-D-00102; NSF OCE-77-08682; NR Proj. 083-004)
(AD-A087665; WHOI-80-2; WHOI-Contrib-4559) Avail: NTIS HC A04/MF A01 CSCL 08/1

High frequency acoustic backscattering systems are being used in monostatic modes to evaluate the use of acoustic techniques to detect and study a variety of fluid processes in the oceanic environment. A short outline of those research programs actively evaluating and using acoustic techniques is presented, followed by a detailed review of this investigator's program. This program uses a multifrequency high frequency acoustic system to study a variety of processes including turbulent mixing, air-sea interactions internal waves, interleaving water masses, natural particulate dispersion and distribution, the dispersion of particulates associated with deep ocean disposal of industrial chemical waste, and biological response to a variety of stimulae including fluid motion, predators, and oceanographic instrumentation. Graphic acoustic data records of several of the above phenomena are described.

ON THE INFERENCE OF OCEANIC CURRENTS OR EDDIES BY SPACEBORNE ALTIMETRY THROUGH THE DYNAMIC METHOD FOR THE DETERMINATION OF THREE DIMENSIONAL DENSITY (TEMPERATURE) FIELD Progress Report
Davidson T. Chen and Vincent E. Noble 18 Jul. 1980 33 p refs
(W05270S00)
(AD-A088082; NRL-MR-4273) Avail: NTIS
HC A03/MF A01 CSCL 08/3

The physical theoretical background, the mathematical governing equations, the absolute error, and the relative error of the dynamic method used in inferring the geostrophic current and eddy systems from the spaceborne altimeter-sensed measurements of dynamic heights or slopes have been laboriously developed. Also, the conditions for the determination of the three dimensional density (temperature) field uniquely are mentioned and explained. The space-borne altimeter is shown to be the instrument for the provision of one condition, i.e., the ocean surface current condition. The three dimensional density (temperature) field and its boundary conditions at the air-sea interface play dominant roles in the weather prediction and the undersea technology. The interchangeable use of the terms of density and temperature fields is valid only when the salinity can be assumed as constant. GRA

THE GULF STREAM MEANDERS EXPERIMENT: CURRENT METER, ATMOSPHERIC, AND SEA LEVEL DATA REPORT FOR THE MOORING PERIOD Data Report, Jan. - May 1979
David A. Brooks, John M. Bane, Robert L. Cohen, and Paul Blankinship (North Carolina State Univ. at Raleigh) Jul. 1980 277 p refs Prepared in cooperation with North Carolina Univ. at Chapel Hill
(Contract N00014-77-C-0354; Grant NSF OCE-79-06710)
(AD-A088069; TAMU-REF-80-7-T) Avail: NTIS
HC A13/MF A01 CSCL 08/3

The principal objective of the Gulf Stream Meanders experiment was to kinematically and dynamically describe the nature of meanders. The upper continental slope region off Onslow Bay, North Carolina was chosen for the experiment site because several previous investigations in that area provided a baseline data set giving some ideas about time and space variability scales within and a several month mean view of the stream. In addition, earlier observations ranging from reports in centuries-old ship logs to recent satellite infrared imagery made it apparent that Gulf Stream meandering was more intense between Charleston and Cape Hatteras than elsewhere in the South Atlantic Bight. Current, sea level, and atmospheric data from the Gulf Stream region off North Carolina for the period January - May 1979 are documented. GRA

STRUCTURE AND FUNCTION IN PHOTOSYNTHETIC MEMBRANES AND THEIR COMPONENTS Annual Progress Report, 1 Dec. 1978 - 30 Nov. 1979
Roderick K. Clayton 1979 16 p refs
(Contract EY-76-S-02-3162)
(COO-3162-51) Avail: NTIS HC A02/MF A01

Structure and function are being studied in photosynthetic membranes and their components, principally with Rhodopseudomonas sphaeroides. That bacteriochlorophyll (Bchl) can have a strongly shifted absorption maximum in the membrane, without the involvement of excitonic Bchl-Bchl interactions was demonstrated. The orientations of pigments in the membrane are being determined, and the orientations of four distinguishable carotenoid components are under investigation. These studies provide data for computations of energy transfer and electron tunneling, and may bear on the mechanism of the electrogenic shifts of the absorption bands of carotenoids. Complexities in the absorption spectra of cytochromes were discovered, and data concerning the distribution of carotenoids between antenna and reaction centers (RCs) in the membrane were found. A corrected interpretation of the action of orthophenanthroline as an inhibitor of electron transport was presented. Some theoretical studies of the problems that may arise in constructing solar cells from natural or artificial RCs were conducted. DOE

A MICROPROCESSOR-BASED CARDIOTACHOMETER Final Report
John A. Donaldson and William G. Crosier 31 Oct. 1979 92 p
(Contract NAS9-14880)
(NASA-CR-160607) Avail: NTIS HC A05/MF A01 CSCL 06B

The development of a highly accurate and reliable cardiotach-

ometer for measuring the heart rate of test subjects is discussed. It measures heart rate over the range of 30 to 250 beats/minute and gives instantaneous (beat to beat) updates on the system output so that occasional noise artifacts or ectopic beats could be more easily identified except that occasional missed beats caused by switching ECG leads should not cause a change in the output. The cardiotachometer uses an improved analog filter and R-wave detector and an Intel 8080A microprocessor to handle all of the logic and arithmetic necessary. By using the microprocessor, future hardware modifications could easily be made if functional changes were needed. R.K.G.

CARDIOPULMONARY DATA ACQUISITION SYSTEM. VERSION 2.0, VOLUME 1: USER'S GUIDE Final Report
17 Dec. 1979 75 p
(Contract NAS9-14880)
(NASA-CR-160608) Avail: NTIS HC A04/MF A01 CSCL 05B

The Cardiopulmonary Data Acquisition System is a computerized method of both collecting and analyzing physiological data on subjects during a treadmill or ergometer stress test in the clinic. The real time acquisition of the physiological data, such as, heart rate, blood pressure, work load, and respiratory gases is accomplished by an LSI-11 microcomputer which displays this data on a hard copy terminal. The data are also concurrently stored on a mass storage device and anytime after the test period a selectable number of copies of the plots or minute reports can be reproduced at the terminal. R.K.G.

THE DEVELOPMENT OF AN ELASTIC REVERSE GRADIENT GARMENT TO BE USED AS A COUNTERMEASURE FOR CARDIOVASCULAR DECONDITIONING
James F. Annis and Paul Webb [1980] 69 p refs
(Contract NAS2-7156)
(NASA-CR-152379) Avail: NTIS HC A04/MF A01 CSCL 06P

Using a new nomex lycra elastic fabric and individualized garment engineering techniques, reverse gradient garments (RGG's) were designed, constructed, and tested for effectiveness as a countermeasure against cardiovascular deconditioning. By combining torso compensated positive pressure breathing with a distally diminishing gradient of counterpressure supplied by the elastic fabric on the limbs, the RGG acts to pool blood in the extremities of recumbent persons much as though they were standing erect in 1 g. The RGG stresses the vasculature in a fashion similar to that experienced by the normally active man, hence preventing or limiting the development of post weightlessness orthostatic intolerance and related conditions. Four male, college age subjects received daily treatments with the RGG during a 15 day bedrest study. Four additional subjects also underwent the bedrest, but received no treatments; they served as controls. The preliminary indication was that the RGG was somewhat effective in limiting the deconditioning process. R.K.G.

A TECHNIQUE FOR THE INJECTION OF RADIOACTIVE TRACER MICROSPHERES DURING ACCELERATION STRESS
Kevin J. Greenless, Clarence M. Oloff, Willi J. Buehring, and Katherine C. Smith Jun. 1980 17 p refs
(AF Proj. 7222; AF Proj. 6893)
(AD-A087931; AMRL-TR-78-114) Avail: NTIS HC A02/MF A01 CSCL 14/2

A microsphere injection system is presented which allows the remote sequential injection of as many as five separately labeled radioactive tracer microspheres while under acceleration stress. Cinemicroscopic observation of the injected microsphere suspension showed little or no microsphere aggregation. Statistical analysis of the microsphere injections on the basis of counts per minute showed 90 - 5.7% of the injection was delivered during three gravities of acceleration. No significant difference in percent injectate delivered was found among the five cartridges. Subjection of the microsphere injection system to 12 G acceleration did not impair proper sequencing or delivery of test solutions. GRA

PROCRU: A MODEL FOR ANALYZING CREW PROCEDURES IN APPROACH TO LANDING Interim Report
S. Baron, R. Muralidharan, R. Lancraft, and G. Zacharias Apr. 1980 223 p refs
(Contract NAS2-10035)
(NASA-CR-152397; BBN-4374) Avail: NTIS HC A10/MF A01 CSCL 05E

A model for analyzing crew procedures in approach to landing is developed. The model employs the information processing structure used in the optimal control model and in recent models for monitoring and failure detection. Mechanisms are added to this basic structure to model crew decision making in this multi task environment. Decisions are based on probability assessments and potential mission impact (or gain). Sub models for procedural activities are included. The model distinguishes among external visual, instrument visual, and auditory sources of information. The external visual scene perception models incorporate limitations in obtaining information. The auditory information channel contains a buffer to allow for storage in memory until that information can be processed. S.F.

PSYCHOPHYSICAL CRITERIA FOR VISUAL SIMULATION SYSTEMS. PHASE 2: EXPERIMENTAL INVESTIGATIONS OF DISPLAY JOINTS AND SCENE INSERTS Final Report
Conrad L. Kraft and Charles D. Anderson Aug. 1980 81 p refs
(Contract F33615-78-C-0012; AF Proj. 6114)
(AD-A088316; AFHRL-TR-80-18) Avail: NTIS HC A05/MF A01 CSCL 05/10

This report describes the approach, procedures, and results of two psychophysical experiments to provide data useful in developing design criteria for visual simulation systems. The first dealt with the influence of the width of joints between display channels on the discrimination of vertical and rotational scene misalignment across the joint. The resulting information indicated that increasing amounts of rotation resulted in an increased percentage of correct detections. This anticipated result was not found for the displacement conditions. It was hypothesized that this unexpected result may have been caused by the counteracting effect of the Poggendorff visual illusion. The second psychophysical experiment dealt with the discrimination of rotational misalignment of scene inserts. Increasing insert size and increasing rotational misalignment produced increased detection performance. The 50% detection threshold occurring at 7 arc seconds of displacement between corresponding portions of the insert and surrounding scenes. Design tolerances based on these data are suggested. GRA

COMPUTER COORDINATION OF LIMB MOTION FOR A THREE-LEGGED WALKING ROBOT
Charles A. Klein and Mark R. Patterson Sep. 1980 108 p refs
(Grant NAG1-30)
(NASA-CR-163566) Avail: NTIS HC A06/MF A01 CSCL 05H

Coordination of the limb motion of a vehicle which could perform assembly and maintenance operations on large structures in space is described. Manipulator kinematics and walking robots are described. The basic control scheme of the robot is described. The control of the individual arms are described. Arm velocities are generally described in Cartesian coordinates. Cartesian velocities are converted to joint velocities using the Jacobian matrix. The calculation of a trajectory for an arm given a sequence of points through which it is to pass is described. The free gait algorithm which controls the lifting and placing of legs for the robot is described. The generation of commanded velocities for the robot, and the implementation of those velocities by the algorithm are discussed. Suggestions for further work in the area of robot legged locomotion are presented. T.M.

ADVANCED MICROBIAL CHECK VALVE DEVELOPMENT Final Report
G. V. Colombo and D. R. Greenley Jun. 1980 34 p
(Contract NAS9-15854)
(NASA-CR-163577) Avail: NTIS HC A03/MF A01 CSCL 06K

A flight certified assembly identified as a Microbial Check Valve (MCV) was developed and tested. The MCV is a canister packed with an iodinated anionic exchange resin. The device is used to destroy organisms in a water stream as the water passes through the device. The device is equally effective for fluid flow in either direction and its primary method of organism removal is killing rather than filtering. The MCV was successfully developed for the space shuttle to: disinfect fuel cell water; and prevent back contamination of the stored potable water supply. One version of the device consists of a high residual iodinated resin bed that imparts approximately 2 ppm of iodine to the fuel cell water as it flows to the potable water tanks. A second version of the device consists of a low residual iodinated resin bed. One of these low residual beds is located at each use port in the potable water system for the dual purpose of removing some iodine from the potable water as it is dispensed and also to prevent back contamination of the potable supply. T.M.

METABOLIC ASPECTS OF CALORIC RESTRICTION (500 CALORIES): BODY COMPOSITION CHANGES
Harry J. Krzywicki, C. Frank Consolazio, Herman L. Johnson, and Norman F. Witt Aug. 1979 27 p refs
(DA Proj. 3A0-25601-A-822)
(AD-A082495; LAIR-73) Avail: NTIS HC A03/MF A01 CSCL 06/5

Body composition changes in 8 healthy adult males were studied while subsisting on a daily liquid diet containing 340 kcal from carbohydrate and 160 kcal from protein for a 10 day period. Half of the subjects (group 1) were denied minerals with the remaining half (group 2) receiving a daily mineral supplement. Body weight losses were severe (5.51 and 4.67 kg) in groups 1 and 2, respectively. This loss was further partitioned into 3.59 kg of fat, 1.4 kg of water, and 0.39 kg of dry protein in

group 1, while group 2 showed losses of 2.76 kg of fat, 1.32 kg of water and 0.39 kg of dry protein. The largest amount of water was lost by the group which was denied minerals. This indicates the water sparing and fat utilizing effects of limited carbohydrate and protein with mineral supplementation. The data indicate that the small quantity of protein in the diet was somewhat beneficial in sparing body protein. E.D.K.

HC A03/MF A01 CSCL 04/1

Catalysts of platinum or palladium on carbon or alumina show promise in removing carbon monoxide (CO) from air at room temperature. As much as 80 percent of the CO in a 230 ppm CO/air powder was removed by 1 g of 5 percent palladium on carbon powder in one pass. Catalysts of 0.5 percent metal on alumina pellets showed comparable efficiency, and proved more convenient to handle. Calculation indicate that the CO concentration in 1000 cu ft of air containing 500 ppm CO could be reduced to 200 ppm in 100 minutes using only 180 g (0.4 pound) of 0.5 percent palladium catalyst and an pump moving 10 cu ft per minute of air (one pass of air through catalyst). Solutions of copper 1 in monoethanolamine proved much less efficient due to oxidation problems. S.F.

A TENTATIVE TAXONOMY OF HUMAN INTERACTIVE FACTORS IN AIRCRAFT MISHAPS Final Report, 1 Apr. 1979 - 1 Mar. 1980
Kenneth W. Wegner May 1980 48 p refs
(Grant AF-AFOSR-0102-79; AF Proj. 2313)
(AD-A088442; AFOSR-80-0595TR) Avail: NTIS
HC A03/MF A01 CSCL 05/8

Previous research and results of the present study lend support to the concept of developing a taxonomy of factors or causes in aircraft mishaps. Twenty-five years of mishap research related to psychophysiological and environmental factors was reviewd to determine the most frequently occurring variables. Twenty-one of these were identified and classified into a tentative taxonomy under three functions: Equipment - Physical Environment, Management System, and Operator. Sixteen definitions related to these factors were available to analyze for reliability and relationship to the taxonomy functions. A survey form was developed which included the above definitions and nine selected aircraft mishap summaries. This instrument was administered to a Flight Safety Officer School class and a group of naive subjects of equivalent age and years of education. The task to be performed was to rate the presence or absence of these causes in each of the mishap summaries. Data analysis performed included the computation of mean agreement rates, inter-case consistency, intercorrelations of selected variables, and comparison of mean agreement rates and judged clarity of the definitions. A HUMAN ENGINEERING SPECIFICATION FOR LEGIBILITY OF ALPHANUMERIC SYMBOLOGY ON VIDEO MONITOR DISPLAYS
E. L. Gorrell Jun. 1980 28 p refs Revised
(AD-A088470; DCIEM-TR-80-R-26-Rev) Avail: NTIS
HC A03/MF A01 CSCL 05/5

Conventional human engineering legibility specifications for alphanumeric symbology displayed on video monitors consist of predictors of user performance derived from legibility research studies. Typical legibility predictors are symbol size, symbol luminance, contrast ratio, font, dot matrix dimensions, and pixel active area. This report discusses a number of significant problems associated with the development and application of conventional legibility specifications. In addition, it presents a detailed specification for comparative and objective evaluation of video monitor legibility performance based upon legibility tests developed for the USAF. This specification consists of criteria for subject selection, visual environment design, display monitor setup, test material design and presentation, legibility task scores, and legibility test performance. It is to be noted that this report is a revision of an earlier report. While the specification for the legibility test has not undergone any major change, the proposed Minimum Conventional Legibility Criteria have been reduced in number. The revised report also includes a new appendix describing in detail a standardized procedure for measuring CRT symbol luminance and calculating contrast ratios. GRA

HEARING PROTECTION AND SPEECH COMMUNICATION CHARACTERISTICS OF SELECTED USAF INFLIGHT HELMETS
Mark R. Stephenson and Donald G. Tomerlin Jun. 1980 22 p refs
(AF Proj. 7231)
(AD-A088099; AFAMRL-TR-80-37) Avail: NTIS
HC A02/MF A01 CSCL 06/17

Hearing protection and speech intelligibility were measured on three widely used flight helmets: the HGU-26/P with standard earcups, HGU-26/P with custom earcups and the DH-151. The following results were obtained: (1) Attenuation tests demonstrated the DH-151 and the standard HGU-26/P generally provide equivalent hearing protection with the former providing somewhat greater protection at the low and high frequencies, but the latter providing somewhat greater protection at the middle frequency region. The custom HGU-26/P provided less hearing protection than both of the above. (2) Replacing earcup assemblies with standard MX8376/AR earcups resulted in equal or improved hearing protection for the HGU-26/P helmet. In the DH-151 helmet, this resulted in less protection at the lower frequencies, but improved protection in the middle frequency range, and no change in the higher frequency range. (3) Speech intelligibility was determined by calculating the articulation index. Both the standard HGU-26/P and the DH-151 provide excellent speech intelligibility. The custom HGU-26/P was found to provide less speech intelligibility than the other two helmets. Nevertheless, we believe it would also permit adequate inflight speech communication. GRA

SLIDESTORE LARGE CAPACITY INFORMATION STORAGE Final Report
Leslie L. Burns 1980 107 p
(Contract NSF DAR-78-21344)
(PB80-187875; NSF/RA-800049) Avail: NTIS HC A06/MF A01 CSCL 09B

A preliminary design for a large scale optical mass memory suitable for government, industrial, and commercial use is presented. The SlideStore feasibility model, which is based on the use of reactangular media for optical data recording by material ablation with a laser beam is decsribed. The unit has successfully recorded raw data and read the data back in a manner that is suitable for transfer to a host computer. Included are descriptions of the model's potential market, the design guidelines, specifications, and media development. Depicted are artists' conceptions of a 2000 slide version of SlideStore for archival information; a 6000 slide version; and a 10 to the 15th power SlideStore memory a 6000 slide version; and a 10 to the 15th power SlideStore memory installation which uses nine 6000 slide SlideStore units as well as off-line storage of DataSlides. Due in considerable measure to its connection with linear programming, the combinatorial study of convex polytopes has progressed greatly in the past twenty five years and many outstanding problems have been solved. However, the d-step conjecture, first formulated by W. M. Hirsch in 1957, remains unsettled. Both for its intrinsic interest and for its relationship to questions of computational complexity, it is probably the most important open problem on the combinatorial structure of polytopes. This report presents several equivalent forms of the d-step conjecture. Some deal explicitly with edge paths on polytopes, one involves matrix pivot operations, and one concerns an exchange process for simplicial bases. GRA

In the area of ranking and selection, recent papers have presented procedures which attempt to allow experimenters to take at least partial advantage of more favorable configurations of the population parameters (compared to least-favorable configuration). The current paper presents a computer program which allows experimenters to dispense with all of inequalities, an indifference-zone, and known equal variabilities in their assessment of the probability of correct selection. It has additional uses in implementation of recently proposed sequential adaptive selection procedures. GRA

A TIME DEPENDENT ERROR DETECTION RATE MODEL

FOR SOFTWARE PERFORMANCE ASSESSMENT WITH APPLICATIONS Interim Technical Report, Sep. 1978 - Oct. 1979
Amrit L. Goel and K. Okumoto Griffiss AFB, N.Y. RADC May 1980 115 p refs
(Contract F30602-78-C-0351; AF Proj. 5581)
(AD-A088186; RADC-TR-80-179) Avail: NTIS HC A06/MF A01 CSCL 12/1

The objective of this study was to develop a parsimonious model whose parameters have a physical interpretation, and which can be used to predict various quantitative measures for software performance assessment. With this objective, the behavior of the software failure counting process (N(t), t equal to or greater than zero) has been studied. It is shown that N(t) can be well described by a nonhomogeneous Poisson process (NHPP) with a two parameter exponentially decaying error detection rate. Several measures, such as the number of failures by some prespecified time, the number of errors remaining in the system at a future time, and software reliability during a mission, have been proposed in this report. Models for software performance assessment are also derived. Two methods are developed to estimate model parameters from either failure count data or times between failures. A goodness-of-fit test is also developed to check the adequacy of the fitted model. Finally, actual failure data are analyzed from two DOD software systems. One is a large command and control system and the other a Naval data analysis system. GRA

Within the scope of this project, a formalism for representing state transitions in a computationally tractable way has been invented, and a proof system based on this formalism has been designed and implemented. The representations of state transitions are called 'state deltas'. The basic proof system has been specialized for proofs about machine language and microcode by the addition of simplification rules for bitstring arithmetic, and by the addition of a translator from the ISPS machine description language to state deltas. Some experimentation with the system has been driven by a preliminary attempt to verify parts of the microcode of the Fault-Tolerant Spaceborne Computer (FTSC). The primary success to date has been the verification of the basic algorithm used for computing floating point square root. GRA

MULTIPLE ACCESS MASS STORAGE NETWORK
Donaldson L. Wentz, Jr. 1980 14 p refs Presented at Networks 80 Intern. Conf., London, 3 Jun. 1980
(Contract W-7405-eng-48)
(UCRL-83929; CONF-800638-1) Avail: NTIS HC A02/MF A01

The multi-access storage subnetwork (MASS) is described which provides shared mass storage for a multiple-host computer configuration. A mass storage facility is interfaced by MASS to large, scientific worker computers to provide an on-line capacity of 1 trillion bits of user-accessible data. The key design features of the subnetwork that contribute to the high performance include the following: a data transmission scheme that provides a 40 Mbit/s channel over distances of up to 1000 ft, a large metal-oxide semiconductor (MOS) memory buffer controlled by a 24 port memory multiplexer with an aggregate data rate of 280 Mbit/s, and a set of high-speed microprocessor based controllers driving the commercial mass storage units. Reliability of the system is provided by a completely redundant network, including two control minicomputer systems. Also enhancing reliability is error detection and correction in the MOS memory. DOE

KNOWLEDGE ACQUISITION, KNOWLEDGE PROGRAMMING, AND KNOWLEDGE REFINEMENT
Frederick Hayes-Roth, Philip Klahr, and David J. Mostow May 1980 39 p
(Grant NSF MCS-77-03273)
(RAND/R-2540-NSF) Avail: NTIS HC A03/MF A01

The iterative refinement of knowledge in response to actual experience is explained. A machine uses knowledge acquired initially from a human, who provides enough concepts, constraints, and problem-solving heuristics to define some minimal level of performance. A learning system must use existing knowledge to plan reasonable courses of action, carry those plans out, and then diagnose weaknesses that explain observed failures or unexpected successes. The processes of planning, acting, and evaluation cooperate to produce new knowledge by refining and extending prior knowledge. A system learn by increasing the scope, precision, validity, and power of its current knowledge. That knowledge includes descriptions and models of the environment, as well as planning and problem solving techniques for achieving goals. Learning requires the system to augment, generalize, specialize, validate, and exploit the knowledge it possesses at any point in time. A.R.H.

WINDFIELD RETRIEVAL FROM DOPPLER LIDAR OBSERVATIONS Interim Technical Report
R. W. Lee Jun. 1980 20 p
(Contract NAS8-33389)
(NASA-CR-161572; ITR-1) Avail: NTIS HC A02/MF A01 CSCL 12A

An approach to the retrieval of a vector wind field from Doppler lidar observations is developed in general terms. The field of radial velocity measurements from each look angle is modeled by a smooth surface, the parameters of the model being determined from the data by least squares techniques. The vector wind field and higher-order fields are obtained from the two modeled surfaces. Estimated measurement errors are taken into account, and error estimates are available for all output data sets. Author

THE DIAMETER OF ALMOST ALL BIPARTITE GRAPHS
V. L. Klee, D. G. Larman, and E. M. Wright May 1980 10 p refs Sponsored in part by Army
(Contract N00014-67-A-0103; NR Proj 044-353)
(AD-A087687; TR-68) Avail: NTIS HC A02/MF A01 CSCL 12/1

The diameter of graphs is addressed with specific reference to the case of bipartite graphs on N labelled points and M = M(N) < or = N labelled points. Of the 2(MN) such graphs, some are disconnected and the others have diameters ranging from 2M or 2M-1 down to 2. Denoting by P(n) the proportion of the graphs which are of diameter 3, it is proved as a necessary and sufficient condition, namely P(n) approaches 1 as n approaches infinity, that M(N) log (4/3)-2 log N approaches positive infinity. Some related results and unsolved problems are also mentioned. M.G.

COMPARISON OF DETECTION PERFORMANCE OF SELECTED TWO-CHANNEL ALGORITHMS Final Report
D. J. Edelblute and C. L. Meland 28 Sep. 1979 40 p refs (ZR0110812)
(AD-A087797; NOSC/TD-328) Avail: NTIS HC A03/MF A01 CSCL 09/4

Recent work on intersensor processing has stimulated interest in techniques for determining information common to two data sequences which may be used for detection, tracking or a combination of these and other functions. Three algorithms which seemed naturally to suggest themselves for intersensor processing were compared. It was determined that the use of a normalization factor significantly degrades detection performance in regions characterized by low time-bandwidth product TW < or = 64. For TW < or = 120, all three algorithms performed about equally on the detection function. The principal implication of this work is that the operating mode of the system (which may dictate the low time-bandwidth product used) may affect the choice of algorithms to be used. In a tactical application where decisions must be made quickly, use of an unnormalized correlator may be mandatory. In a situation where long integration times are acceptable, a normalized formula such as the coherence detector may be chosen for data processing, as opposed to signal processing, economies. GRA

AN ALGORITHM FOR LINEARLY CONSTRAINED NONLINEAR PROGRAMMING PROBLEMS Interim Report
Mokhtar S. Bazaraa and Jamie J. Goode 1980 23 p refs
(Contract F49620-79-C-0120; AF Proj. 2304)
(AD-A085458; AFOSR-80-0449TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

An algorithm for solving a linearly constrained nonlinear programming problem was developed. Given a feasible point, a correction vector was computed by solving a least distance programming problem over a polyhedral cone defined in terms of the gradients of the almost binding constraints. Mukai's approximate scheme for computing step sizes was generalized to handle the constraints. This scheme provided an estimate for the step size based on a quadratic approximation of the function. This estimate was used in conjunction with Armijo line search to calculate a new point. Each accumulation point is a Kuhn-Tucker point to a slight perturbation of the original problem. Under suitable second order optimality conditions, eventually only one trial is needed to compute the step size. T.M.

INVERTIBLE BINARY MATRICES
Thomas C. Jedrey May 1980 14 p ref
(DA Proj. 1L1-61101-A-91A)
(AD-A085575; HDL-TM-80-13) Avail: NTIS HC A02/MF A01 CSCL 12/1

Two procedures are developed for the generation of an invertible modulo two matrix which satisfies an algorithm that minimizes the number of nonzero coefficients in a Haar expansion of a Boolean function. The first method is based on an algorithm for the production of invertible modulo two matrices, while the other produces the required matrix by a direct examination of the input vector T. Both methods have been implemented in VSAPL, and the program for the second technique, which can generate much larger matrices, is included. M.G.

GENERIC PROPERTIES OF AN INTEGRO-DIFFERENTIAL EQUATION Interim Report
Jack K. Hale Jun. 1980 14 p refs
(Contract DAAG29-79-C-0161; Grants AF-AFOSR-3092-76; NSF MCS-79-05774; AF Proj. 2304)
(AD-A088242; AFOSR-80-0575TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Consider the functional differential equation where a,g are continuous. The linear function is such that the characteristic equation has two eigenvalues on the imaginary axis and the remaining ones with negative real parts. In spite of this, it is shown there is no generic Hopf bifurcation for any g. The nature of the bifurcation is characterized under hypotheses which appear to be generic in g. GRA

A ZERO-ONE LAW FOR A CLASS OF MEASURES ON GROUPS
Balram S. Rajput, Donald Louie, and Albert Tortrat (Paris Univ., France) Sep. 1979 11 p refs
(Contract N00014-78-C-0468)
(AD-A088374; TR-7905) Avail: NTIS HC A02/MF A01 CSCL 12/1

Let (E beta) be a measurable (nonabelian) group, alpha a measurable homomorphism on E and mu a law on (E beta) satisfying mu = mu(alpha) v(alpha) (with mu(alpha) = mu o/alpha), for some law v(alpha) on (E beta). Under some additional conditions it is shown that, for every proper normal subgroup G of E and a in E, if Ga is an element of beta (mu), the mu-completion of B, then mu(Ga) = 0 or 1. As a corollary, it is shown that this result yields all previously known 0-1 laws for stable, semistable, and quasistable laws on linear spaces as well as new 0-1 laws for other classes of infinitely divisible laws on linear spaces. SOME GRAPHICAL CONSIDERATIONS IN TIME SERIES ANALYSIS Interim Report
Benjamin Kedem Jun. 1980 27 p refs
(Grant AF-AFOSR-0211-80; AF Proj. 2304)
(AD-A088246; MD80-43-BK; AFOSR-80-0590TR; TR-80-41) Avail: NTIS HC A03/MF A01 CSCL 12/1

The pictorial information in a stationary time series as depicted by crossings of levels and crossings of random levels and related quantities is studied. It is shown that such graphical features are directly connected with the covariance function and hence with the spectral density. Many of these features can be actually applied in estimation and in the study of extremes. In the Gaussian case, the finite dimensional distributions are completely determined by the axis crossings and by the crossings of a random curve (to be defined) if the process is essentially bounded. NEAR-EQUIVALENCE OF NETWORK FLOW ALGORITHMS
Norman Zadeh 1 Dec. 1979 55 p refs
(Contract N00014-75-C-0493; Grant NSF ENG-76-12266; NR Proj. 042-264)
(AD-A088032; SU-TR-36) Avail: NTIS HC A04/MF A01 CSCL 12/1

Network problems arising in practice typically have non-negative arc costs. On such problems, we show that the following algorithms perform, modulo ties, the same sequence of flow augmentations. (1) Simplex (with the standard pivot rule and Big-M start), (2) Out-of-Kilter (Primal-Dual), (3) Dual Simplex (with the standard pivot rule), (4) Lemke's Complementary Pivot Algorithm. All methods compute a shortest path tree by mimicking the Dijkstra algorithm and then send flow along a sequence of minimum cost paths. Differences in implementation are discussed. It becomes clear that Dantzig's simplex method with the best empirical pivot rule (not the standard rule) will outperform other methods (variations of Simplex with the standard rule). A simple reason is given why Dual Simplex (best empirical) cannot do as well as Simplex (best empirical). GRA

ON MEASURING THE CONFORMITY OF A PARAMETER SET TO A TREND, WITH APPLICATIONS
Tim Robertson and F. T. Wright (Missouri Univ. -Rolla) Jul. 1980 27 p refs
(Contracts N00014-80-C-0321; N00014-80-C-0322; Grant NSF MCS-78-01514)
(AD-A087946; TR-3) Avail: NTIS HC A03/MF A01 CSCL 12/1

Consider the hypothesis H (sub 1): theta (sub 1 >) or = theta (sub 2 >) or = theta (sub k) regarding a collection, of unknown parameters. It is clear that this trend is reflected in certain possible parameter sets more than in others. A quantification of this notion of conformity to a trend, which was suggested by Barlow and Brunk (1972), is studied. Applications of the resulting theory to several order restricted hypothesis tests are presented. GRA

FUNCTIONAL DIFFERENCE EQUATIONS AND AN EPIDEMIC MODEL Interim Report
Lawrence Turyn 9 Jun. 1980 14 p refs Presented at Intern. Conf. on Nonlinear Phenomena in Math. Sci., Arlington, Tex., 16-20 Jun. 1980
(Grant AF-AFOSR-3092-76; AF Proj. 2304)
(AD-A088108; AFOSR-80-0565TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

We consider an epidemic model for the form S implies I which implies S with history on (-infinity, 0). The well-known threshold phenomenon is discussed in terms of the stability of a functional difference equation, also known as the translation-invariant renewal equation. Since the difference equation has infinite delay, the work of other authors on finite-delay problems is extended. Also, epidemic models with spatial effects are discussed by extension of the results to difference equations in a Banach space. GRA

A UNIQUENESS THEOREM FOR ORDINARY DIFFERENTIAL EQUATIONS Interim Report
M. J. Norris (Sandia National Labs., Albuquerque, N. Mex.) May 1980 8 p refs
(Contracts F49620-79-C-0129; DE-AC04-76DP-00789; AF Proj. 2304)
(AD-A088113; AFOSR-80-0585TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

A uniqueness theorem is proved which answers an open question for a system of differential equations arising in a certain n-body problem of classical electrodynamics. The essence of the results can be illustrated using the scalar prototype equation x' = g sub 1(x) + g sub 2 (t + x) with x(0) = 0. The solution of the latter is unique provided g sub 1 and g sub 2 are continuous positive functions of bounded variation. M.G.

RAPID SOLUTION OF FINITE ELEMENT EQUATIONS ON LOCALLY REFINED GRIDS BY MULTI-LEVEL METHODS Ph.D. Thesis
John R. VanRosendale May 1980 123 p refs
(Grant AF-AFOSR-2854-75; AF Proj. 2304)
(AD-A088065; UIUCDCS-R-80-1021; UILU-ENG-80-1712; AFOSR-80-0591TR) Avail: NTIS HC A06/MF A01 CSCL 12/1

This thesis is concerned with the use of multi-level methods to solve the linear systems arising from finite element discretizations of elliptic equations. In all, three multilevel methods are considered. The first of these is applicable only to quasi-uniform grids, but is simpler than other algorithms considered in previous theoretical work. The other two algorithms are applicable to both quasi-uniform grids, and locally refined grids, those grids on which the size of the largest and smallest elements many differ by an arbitrarily large factor. All three algorithms are asymptotically optimal, producing good solutions in O(N) operations on a finite element grid with N elements. These asymptotically optimal complexity bounds for the last two algorithms are the first such bounds for multilevel methods on locally refined grids. One of these algorithms achieves this O(N) complexity bound under weaker than expected conditions on the dimensions of the finite element spaces used by the algorithm. GRA

(AD-A088023; ARAP-TM-80-6) Avail: NTIS
HC A04/MF A01 CSCL 12/1

Under appropriate conditions, ocean waves may be modeled by certain nonlinear evolution equations that admit soliton solutions and can be solved exactly by the inverse scattering transform (IST). The theory of these special equations is developed in five lectures. As physical models, these equations typically govern the evolution of narrow-band packets of small amplitude waves on a long (post-linear) time scale. This is demonstrated in lecture 1, using the Korteweg-deVries equation as an example. Lectures 2 and 3 develop the theory of IST on the infinite interval. The close connection of aspects of this theory to Fourier analysis, to canonical transformations of Hamiltonian systems, and to the theory of analytic functions is established. Typical solutions, including solitons and radiation, are discussed as well. With periodic boundary conditions, the Korteweg-deVries equation exhibits recurrence, as discussed in lecture 4. The fifth lecture emphasizes the deep connection between evolution equations solvable by IST and Painleve transcendents, with an application to the Lorenz model. GRA

THE OFF-LINE USE OF A SEQUENTIAL ESTIMATOR
Thomas G. Robertazzi and Stuart Schwartz Jul. 1980 81 p refs
(Contract N00014-80-C-0530; NR Proj. 042-385)
(AD-A088178; TR-4) Avail: NTIS HC A05/MF A01 CSCL 12/1

The straightforward application of a sequential estimator to nonlinear regression (curve fitting) problems is generally not possible when good a priori parameter estimates are not available and also when minimizing the error over a local portion of the data does not insure that it is minimized globally. However, a sequential estimator may be easily utilized to perform off-line processing in such a situation. The key is to process the measurements in a random order rather than the causal order in which they occur. The off-line use of an extended Kalman filter is illustrated in terms of a particular application. This technique is essentially a sequential version of the Gauss-Newton minimization procedure with relinearization being performed after each measurement is processed. Fictitious measurement noise is necessary to prevent filter divergence and is included in a very simple manner. Computational savings over more conventional iterative minimization techniques are possible if the functions and partial derivatives involved are sufficiently complex to evaluate. But there is a real question regarding the extent to which convergence can be assured. The results of simulations are presented. GRA

ON THE ALMOST SURE CONVERGENCE OF WEIGHTED SUMS OF RANDOM ELEMENTS IN D(0, 1) Interim Report
Robert Lee Taylor and C. A. Calhoun Jun. 1980 15 p refs
(Contract F49620-79-C-0140; AF Proj. 2304)
(AD-A088330; TR-56; AFOSR-80-0570TR) Avail: NTIS
HC A02/MF A01 CSCL 12/1

The convergence of weighted sums of random elements in D(0,1) was obtained by Taylor and Daffer (1979) using a number of conditions such as convex tightness, moment conditions, and others. In this paper both the moment conditions and the tightness conditions are substantially relaxed in obtaining the almost sure convergence of weighted sums of random elements in D(0,1). In addition, a brief discussion of the necessary integral conditions will be included which will delineate these results and previous work. GRA

AUTOMATIC MULTIRATE METHODS FOR ORDINARY DIFFERENTIAL EQUATIONS
C. W. Gear Jan. 1980 15 p refs
(Contract DE-AS02-76ER-02383)
(COO-2383-0062; UIUCDS-R-80-1000; UILU-ENG-80-1701)
Avail: NTIS HC A02/MF A01

A study is made of the application on integration methods in which different step sizes are used for different members of a system of equations. Such methods can result in savings if the cost of derivative evaluation is high or if a system is sparse; however, the estimation and control of errors is very difficult and can lead to high overheads. Three approaches are discussed, and it is shown that the least intuitive is the most promising. DOE

ESTIMATORS FOR THE TRUNCATED BETA-BINOMIAL DISTRIBUTION
Conwin L. Atwood 1980 32 p refs Presented at 173d Inst. of Math. Statistics Conf., Davis, Calif., 16 Jun. 1980
(Contract DE-AC07-76ID-01570)
(CONF-800644-1) Avail: NTIS HC A03/MF A01

Let X have a beta-binomial(m,p,theta) distribution, truncated such that X > t for t = 0 or 1. Suppose that independent observations of X are available. A consistent estimator of (p,theta) is given, based on the first three sample moments. This may be used as a start for maximum likelihood estimation (MLE) or jackknifing. The standard assumptions for a C(alpha) test that X is truncated binomial do not hold; however a test is proposed based on jackknifing the sample variance of X. Some Monte Carlo comparisons are given. For moderately small data sets, these comparisons show that the moment estimator is often superior to the MLE, and the C(alpha) test is superior to other proposed tests, in spite of its lack of theoretical justification. DOE

DETECTING CHANGE POINTS IN SAMPLING FROM MULTINOMIAL DISTRIBUTIONS
Alan E. Gelfand 4 Mar. 1980 44 p refs
(Contract N00014-76-C-0475; Grant DAAG29-77-G-0031; NR Proj. 042-267)
(AD-A087898; TR-282) Avail: NTIS HC A03/MF A01 CSCL 12/1

The question of if and when a change in the underlying cell frequencies has occurred during the observation of a sequence of categorical variables is analyzed. Several techniques are developed that may be loosely grouped into three classifications: (1) central limit theorem approaches, (2) departure from centrality approaches and (3) test of homogeneity approaches. The approaches monitor the sequence either at every trail or at every kth trial. All approaches construct statistics which are functions of sequential sums either weighted or unweighted. The behavior of these sums and the statistics developed from them are discussed in detail. A large scale simulation study is discussed in an attempt to assess the performance of the approaches. Three approaches emerge as most promising but a clear choice among these is not possible at present. GRA

THE INFLUENCE CURVE AND GOODNESS OF FIT
John R. Michael and William R. Schucany (Southern Methodist Univ.) May 1980 24 p refs
(Contract N00014-75-C-0439; NR Proj. 042-280)
(AD-A085593; TR-137) Avail: NTIS HC A02/MF A01 CSCL 12/1

The influence curve introduced by Hampel is applied to goodness of fit statistics. The efficacy curve is then defined to be the square of influence curve weighted by a constant which arises in the context of approximate Bahadur efficiency. For a number of goodness of fit statistics the ratios of these curves are shown to be equal to the asymptotic relative efficiency in the Pitman sense when testing for point contamination. These efficacy curves graphically demonstrate the sensitivities of certain goodness of fit statistics to minor perturbations in the assumed distribution. GRA

ANALYSIS OF NONLINEAR STOCHASTIC SYSTEMS WITH WIDE-BAND INPUTS Interim Report
Harold J. Kushner and Y. Bar-Ness Jun. 1980 20 p refs
(Contract N00014-76-C-0279; Grants AF-AFOSR-3063-76; NSF ENG-77-12946; AF Proj. 2304)
(AD-A088243; AFOSR-80-0578TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

A general method for approximating systems with wide-band inputs by diffusion processes is discussed. The input noise itself can be processed nonlinearly by elements of the system. One particular case, examined in detail, is that of a hard limiter just after the input. The results suggest that the limiter can actually improve performance if the noise intensity is small. The development illustrates how tricky, but potentially useful, nonlinearities can be handled when the system input is wide-band noise. GRA

ON NEAREST NEIGHBOR DEGENERACIES OF INDISTINGUISHABLE PARTICLES Interim Report
Benjamin Kedem Jun. 1980 22 p refs
(Contract F49620-79-C-0095; AF Proj. 2304)
(AD-A088247; MD80-37-BK; TR-80-36; AFOSR-80-0589TR)
Avail: NTIS HC A02/MF A01 CSCL 12/1

Arrangement degeneracies suggested by sufficient statistics associated with binary stationary mth order Markov chains are discussed, and are shown to correspond and generalize some degeneracies arising when indistinguishable particles are placed on a one dimensional lattice with n compartments. From these statistics it is possible to define an mth order unit. The arrangement degeneracy obtained from s 1's and n-s 0's so that lower order units are placed in higher order units is solved. However, the most general arrangement degeneracy associated with all the sufficient statistics of a given order is difficult. For this case only the 3rd order arrangement degeneracy is obtained, the 1st and 2nd orders being relatively simple. These results are applied in determining the asymptotic distributions of rare events. GRA

NONPARAMETRIC BAYES ESTIMATION OF DISTRIBUTION FUNCTIONS AND THE STUDY OF PROBABILITY

DENSITY ESTIMATES Interim Report, 1 Jun. 1979 - 31 May 1980
W. J. Padgett, R. L. Taylor, and L. J. Wei 30 Jun. 1980 18 p refs
(Contract F49620-79-C-0140; AF Proj. 2304)
(AD-A088250; AFOSR-80-0571TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

In work under this grant, major results were obtained in the four broad areas of survival analysis and life testing, probability density estimates and laws of large numbers, estimation after testing, and robustness and distribution-free procedures. In particular, nonparametric estimators of the failure rate function and survival probability were developed under the assumption of increasing failure rate using both maximum likelihood and Bayesian approaches. These particular results have attracted wide attention due to their generality and applicability in survival analysis and reliability estimation from arbitrarily right-censored data. Also, consistency results for both univariate and multivariate kernel estimates for probability density functions and regression functions were obtained using techniques and results of function-space probability theory. Sequential procedures were developed and analyzed which provided interval estimators of the parameter of interest after testing certain hypotheses. Various robustness and nonparametric methods for incomplete samples and broken samples were also studied. Thus, maintenance policies and development of new, more reliable, equipment may be formulated using statistical procedures and theory from these results. GRA

N80-33157# South Carolina Univ., Columbia. Dept. of Mathematics, Computer Science and Statistics.
ASYMPTOTIC CONSERVATIVENESS AND EFFICIENCY OF KRUSKAL-WALLIS TEST FOR K DEPENDENT SAMPLES Interim Report
L. J. Wei May 1980 14 p refs
(Contract F49620-79-C-0140; AF Proj. 2034)
(AD-A088249; AFOSR-80-0566TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The robustness (asymptotic conservativeness) of Kruskal-Wallis test under certain departures from mutual independence of K univariate samples is established. This robustness provides a procedure for testing the equality of K marginal distribution functions on a broken random sample from a K-variate distribution which satisfies a mild condition. For the unbroken sample, a generalized Kruskal-Wallis test is proposed for testing the symmetry of a K-dimensional distribution function. The relative efficiency of the K-W test against the aligned rank order test is also examined under the normal shift model. GRA

SOME BAYES ESTIMATORS OF RELIABILITY FOR THE INVERSE GAUSSIAN LIFETIME MODEL Interim Report
W. J. Padgett Feb. 1980 13 p refs
(Contract F49620-79-C-0140; AF Proj. 2304)
(AD-A088078; AFOSR-80-0584TR; TR-53) Avail: NTIS HC A02/MF A01 CSCL 12/1

Bayes estimation of the reliability function for the inverse Gaussian distribution is discussed. For the case that the mean lifetime is known, Bayes estimators are obtained with Jeffreys' noninformative prior and with the natural conjugate prior for the scale parameter. In the case that both parameters are unknown, an estimator of reliability is suggested which is based on the Bayes estimator obtained for the case that the mean lifetime is known. This estimator is not Bayes but compares favorably with the maximum likelihood and minimum variance unbiased estimators as indicated by computer simulations. GRA

ON THE FIRST PASSAGE TIME DISTRIBUTION FOR A CLASS OF MARKOV CHAINS
Mark Brown and C. N. Rao Jul. 1980 17 p refs
(Contract F49620-79-C-0157; Grant AF-AFOSR-3678-78; AF Proj. 2304)
(AD-A088111; FSU-Statistics-M552; TR-79-B5; AFOSR-80-0581TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Consider a stochastically monotone Markov chain with monotone paths on a partially ordered countable set S. Let C be an increasing subset of S with finite complement. Then the first passage time from an element of S to C is shown to be IFRA (increasing failure rate on the average). Several applications are presented including coherent systems, shockmodels, and convolutions of IFRA distributions. GRA

A ROBUST CONFIDENCE INTERVAL FOR SAMPLES OF FIVE OBSERVATIONS
Karen Kafadar Nov. 1979 27 p refs
(Grant DAAG29-76-G-0298)
(AD-A088071; TR-154-SER-2; ARO-14244.14-M) Avail: NTIS HC A03/MF A01 CSCL 12/1

A robust confidence interval using biweights for the case of five observations is proposed when the underlying distribution has somewhat heavier tails than the Gaussian. The distribution of a t-like statistic is approximated by a Student's t on the nominal four degrees of freedom using different scale factors which depend upon the value of the biweight weights. Results given by Monte Carlo simulations indicate that, even for very high coverage probabilities, the intervals proposed are highly efficient, in terms of the expected length of the confidence interval. A ROBUST ESTIMATOR OF THE DIFFERENCE BETWEEN LOCATION PARAMETERS OF CORRELATED VARIABLES FOR FRAGMENTARY SAMPLES Interim Report
L. J. Wei Apr. 1980 16 p refs
(Contract F49620-79-C-0140)
(AD-A088109; AFOSR-80-0569TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

A simple and robust estimator of the difference of location parameters of correlated variables is proposed when some observations on either of the variables are missing. We show that this estimator is consistent, asymptotically normally distributed, and insensitive to outlying observations. Asymptotic relative efficiency comparisons with other known estimators are made to show the advantage of the proposed estimator. GRA

LIKELIHOOD RATIO TESTS FOR AND AGAINST A STOCHASTIC ORDERING BETWEEN MULTINOMIAL POPULATIONS TESTS FOR A STOCHASTIC ORDERING
Tim Robertson and F. T. Wright 17 Jul. 1980 23 p refs
Prepared in cooperation with Missouri Univ., Rolla.
(Contracts N00014-80-C-0321; N00014-80-C-0322)
(AD-A088194; TR-2) Avail: NTIS HC A02/MF A01 CSCL 12/1

Likelihood ratio tests concerning the parameters of two multinomial populations are discussed. A stochastic ordering restriction is considered as a one sided alternative to equality. The one and two sample tests for equality versus stochastic ordering and stochastic ordering versus all alternatives are derived and their large sample distributions are obtained. The large sample distributions are mixtures of chi-squared distributions. The tests developed provide discrete analogues for the one sided Mann-Whitney-Wilcoxin and Kolmogorov-Smirnov tests. GRA

(Contract DAAG29-79-C-0154)
(AD-A088079; ARO-16231.5-EL) Avail: NTIS HC A03/MF A01 CSCL 12/2

In view of the growing prominence of corporate modeling, an important area of research concerns techniques for facilitating the design and utilization of models. In this paper, we show how first-order predicate calculus can be used as a language for formally stating modeling knowledge. Furthermore, knowledge stated in this manner can be subjected to the resolution principle. The result is that application specific modeling knowledge need not be embedded in a computer program. Rather, it can be stored in a data base and utilized as needed by a problem processing system employing resolution techniques. Advantages of a decision support system taking an approach of this sort are considerable modeling flexibility, capacity for automating the model formulation and execution processes, and compatibility with a high-level user interface language. QUALITATIVE MATRICES: STRONG SIGN-SOLVABILITY AND WEAK SATISFIABILITY
Victor Klee and Richard Ladner May 1980 37 p refs
(Contracts N00014-76-C-0423; N00014-67-A-0103; Grant NSF MCS-77-02474; NR Proj. 044-353)
(AD-A087686; TR-80-05-01; TR-69) Avail: NTIS HC A03/MF A01 CSCL 12/1

The study of 'qualitative' linear systems was suggested by Paul Samuelson in 1947 in his influential book on Foundations of Economic Analysis. The present paper deals with a rather general form of qualitative solvability, of which strong sign-solvability is a special case, and with a closely related notion, weak satisfiability, from propositional logic. The study of strong sign-solvability is reduced to that of s-matrices and a conjecture of T. Gorman on the structure of S-matrices is elucidated. An algorithm is described which uses linear programming methods to recognize S-matrices (and much more general systems) and thus solves this recognition problem is polynomial time. However, this is close to the boundary of NP-completeness, for the closely related problem of recognizing weak satisfiability is shown to be NP-complete. GRA

SUPRALGEBRAS, SUPERGROUPS AND GEOMETRIC GAUGING
Yuval Neeman Dec. 1979 42 p refs Submitted for publication Supported in part by the US-Israel Binational Science Foundation
(Contract DE-AS05-76ER-03992)
(ORO-3992-384) Avail: NTIS HC A03/MF A01

Superalgebras, supergroups, and supermanifolds are discussed under the following headings: supers enter physics and mathematics; superalgebras; superconformal and super-Poincare algebras; the Z(2) and Z graded Grassman rings; supermanifolds; the classification of simple Lie superalgebras; classical superalgebras; the orthosymplectic sequences; classical hyperexceptional and exceptional superalgebras; nonclassical superalgebras; and supergroups. Gauging a supergroup has yielded an embedding of the Weinberg-Salam model of asthenodynamics in a highly constraining aesthetic theory. In this part, dealing with forms on a (rigid) group manifold, a principal bundle, and a soft (Dali) group manifold, the elements of the exterior calculus are developed on a Lie group manifold. Then the geometric theory of gauging is obtained; for a local internal symmetry, this is done on a principal bundle. For a noninternal group, such as the Poincare or super-Poincare group, Gravity and Supergravity are reproduced by use of a soft group manifold. DOE

HC A03/MF A01 CSCL 14/5

Electromagnetic methods of nondestructive testing are discussed, detecting defects in metal parts. A major stumbling block in the development of these techniques, particularly with regard to the study of automated defect characterization schemes, is the lack of a suitable model capable of predicting the inherent complex field/defect interactions. The feasibility of applying finite element analysis techniques to the modeling of (1) active leakage field (2) residual leakage field and (3) eddy current methods of nondestructively testing metal structures is examined. The use of numerical analysis techniques shows the interrelationship of all the electromanetic nondestructive phenomena and the need for accurate material property (conductively and permeability) values. A FUNCTIONAL FOR FINITE ELEMENT ANALYSIS OF LOW INTENSITY MAGNETIC FIELDS INCLUDING PERMANENT MAGNETIZATION EFFECTS
John W. Frye 17 Jun. 1980 9 p refs
(AD-A088230; NUSC-TR-6289) Avail: NTIS
HC A02/MF A01 CSCL 20/3

A functional is presented that is useful in the finite element analysis of low intensity, static magnetic field solutions. The variational principle is written in terms of a scalar potential function and, when minimized, leads to field equations and boundary conditions that characterize a magnetic field, accounting for the presence of current, permanent magnetization, and incident magnetic fields. This variational principle finds applications in the finite element analysis of magnetic field problems. GRA

HC A05/MF A01 CSCL 20A

Acoustic wind tunnel tests were conducted of a wing model with modified leading edge slat and trailing edge flap. The modifications were intended to reduce the surface pressure response to convected turbulence and thereby reduce the airframe noise without changing the lift at constant incidence. Tests were conducted at 70.7 and 100 m/sec airspeeds, with Reynolds numbers 1.5 x 10 to the 6th power and 2.1 x 10 to the 6th power. Considerable reduction of noise radiation from the side edges of a 40 deflection single slotted flap was achieved by modification to the side edge regions or the leading edge region of the flap panel. Total far field noise was reduced 2 to 3 dB over several octaves of frequency. When these panels were installed as the aft panel of a 40 deg deflection double slotted flap, 2 dB noise reduction was achieved. R.C.T.

VISCOUS THEORY OF SURFACE NOISE INTERACTION PHENOMENA Final Report
John E. Yates Sep. 1980 44 p refs
(Contract NAS1-15539)
(NASA-CR-3331; ARAP-419) Avail: NTIS HC A03/MF A01 CSCL 20A

A viscous linear surface noise interaction problem is formulated that includes noise production by an oscillating surface, turbulent or vortical interaction with a surface, and scattering of sound by a surface. The importance of viscosity in establishing uniqueness of solution and partitioning of energy into acoustic and vortical modes is discussed. The results of inviscid two dimensional airfoil theory are used to examine the interactive noise problem in the limit of high reduced frequency and small Helmholtz number. It is shown that in the case of vortex interaction with a surface, the noise produced with the full Kutta condition is 3 dB less than the no Kutta condition result. The results of a study of an airfoil oscillating in a medium at rest are discussed. It is concluded that viscosity can be a controlling factor in analyses and experiments of surface noise interaction phenomena and that the effect of edge bluntness as well as viscosity must be included in the problem formulation to correctly calculate the interactive noise. MODAL CONTENT OF NOISE GENERATED BY A COAXIAL JET IN A PIPE
E. J. Kerschen and J. P. Johnston May 1978 271 p refs
(Grants NsG-2007; NSF GK-37294; NSF ENG-76-00819)
(NASA-CR-163575; SU-JIAA-TR-11) Avail: NTIS
HC A12/MF A01 CSCL 20A

Noise generated by air flow through a coaxial obstruction in a long, straight pipe was investigated with concentration on the modal characteristics of the noise field inside the pipe and downstream of the restriction. Two measurement techniques were developed for separation of the noise into the acoustic duct modes. The instantaneous mode separation technique uses four microphones, equally spaced in the circumferential direction, at the same axial location. The time-averaged mode separation technique uses three microphones mounted at the same axial location. A matrix operation on time-averaged data produces the modal pressure levels. This technique requires the restrictive assumption that the acoustic modes are uncorrelated with each other. The measured modal pressure spectra were converted to modal power spectra and integrated over the frequency range

200-6000 Hz. The acoustic efficiency levels (acoustic power normalized by jet kinetic energy flow), when plotted vs. jet Mach number, showed a strong dependence on the ratio of restriction diameter to pipe diameter. The acoustic energy flow analyses based on the thermodynamic energy equation and on the results of Mohring both resulted in orthogonality properties for the eignfunctions of the radial mode shape equation. These orthogonality relationships involve the eigenvalues and derivatives of the radial mode shape functions. F.O.S.

A CONSTANT PERCENTAGE BANDWIDTH TRANSFORM FOR ACOUSTIC SIGNAL PROCESSING
James E. Youngberg Jan. 1980 121 p refs
(Contract N00173-79-C-0045)
(AD-A085666; UTEC-CS-80-004) Avail: NTIS HC A06/MF A01 CSCL 20/1

A constant percentage bandwidth transform for acoustic signal processing is described. A synthesis transformation is developed which, cascaded with the analysis transformation provides an analysis-synthesis identity in the absence of spectral modification. The effects of spectral domain modification are described. Principles governing discrete implementation of the transform pair are discussed, and relationships are formalized which specify minimal sample requirements for the spectral domain. The Constant-Q spectral magnitude and phase functions are discussed, and three main methods are evaluated whereby the spectral requirements be unwrapped. The use of the transform pair is discussed in the solution of the perception related problem of time scale compression and expansion of speech. R.C.T.

SCATTERING MATRIX ANALYSIS OF SURFACE ACOUSTIC WAVE REFLECTIONS AND TRANSDUCERS Ph.D. Thesis
Carl Michael Panasik Feb. 1980 70 p refs
(Contracts F19628-78-C-0040; N00014-79-C-0424)
(AD-A085764; UILU-ENG-80-2205; R-873) Copyright. Avail: NTIS HC A04/MF A01 CSCL 20/1

The phased periodic array scattering parameters were modified and corrected for use as a single electrode, mixed units, scattering matrix consisting of one electrical and two acoustic port. These scattering parameter analytical expressions are functions of material constants, electrode geometry, and frequency. The three port single electrode scattering matrices are acoustically cascaded to produce a three port device scattering matrix which takes into account all finger interactions (acoustic and electric) for the combined effects of piezoelectric and mechanical scattering. The analysis agrees well with experimental measurements of input admittance, electro-acoustic transfer function, and acoustic transmission and reflection coefficients as functions of frequency. Analysis results for the complete modeling of transducers with floating electrodes are also presented. Author

SIGNAL PROCESSING ASPECTS OF NONLINEAR ACOUSTICS
T. G. Muir and Tommy G. Goldsberry 7 Jul. 1980 37 p refs
Presented at the NATO Advan. Study Inst. on Underwater Acoustics and Signal Process., Copenhagen, 18-29 Aug. 1980
(Contract N00014-75-C-0161)
(AD-A088369; ARL-TR-80-38) Avail: NTIS HC A03/MF A01 CSCL 20/1

The topic of nonlinear acoustics has been included at previous NATO study institutes going back to 1966. The first treatment, by Berktay, speculated on the possibilities nonlinear effects might offer. In 1968, Mellen illustrated some of these possibilities through laboratory tank experiments. Berktay returned in 1972 to present some engineering models for the design of parametric sources. In 1976, Bjorno presented a survey of theoretical and experimental results on parametric arrays developed at several laboratories. Today, research and development in nonlinear acoustics has gravitated toward applications. The present paper therefore addresses applications with a view towards outlining the unique features of nonlinear arrays, especially with regard to signal processing. Both nonlinear sources and receivers will be discussed. GRA

STUDY OF LATERAL EXCESS SOUND ATTENUATION AS DETERMINED FROM FAR PART 36 AIRCRAFT NOISE CERTIFICATION MEASUREMENTS
Dwight E. Bishop and Jane M. Beckmann Wright-Patterson AFB, Ohio Air Force Aerospace Medical Research Lab. Jul. 1980 58 p refs
(Contract F33615-79-C-0501; AF Proj. 7231)
(AD-A088285; BBN-4225; AFAMRL-TR-80-65) Avail: NTIS HC A04/MF A01 CSCL 20/1

This report presents information on the variation of the lateral excess attenuation as a function of elevation angle. Lateral excess attenuation represents the differences between the noise levels measured directly underneath the aircraft and to the side of the aircraft, after adjustment for differences in distance and air absorption. This information was developed from analysis of 'takeoff' and 'sideline' noise data acquired during FAR 36 civil aircraft noise certification tests. The study shows that useful excess attenuation information can be developed from aircraft certification data provided steps are taken to locate sideline positions so that measurements adequately cover the range of low elevation angles. The measured excess attenuation values show trends with frequency that are consistent with measurements observed in recent Air Force tests in the frequency range up to about 400 Hz. Larger excess attenuation values were measured at higher frequencies for reasons that are not known at this time. The perceived noise level (PNL), and A-level (AL), curves for each of the aircraft were generally similar in shape however the excess attenuation values for PNL were slightly larger than the AL values, with the difference most pronounced for the C-130H aircraft. GRA

USAF BIOENVIRONMENTAL NOISE DATA HANDBOOK. VOLUME 119: C-135B AIRCRAFT, NEAR AND FAR-FIELD NOISE
Robert G. Powell Dec. 1979 149 p
(AF Proj. 7231)
(AD-A087953; AFAMRL-TR-75-50-Vol-119) Avail: NTIS HC A07/MF A01 CSCL 01/2

The USAF C-135B is a long range, high performance, transport aircraft powered by four TF33-P-5 turbofan engines. This report

provides measured and extrapolated data defining the bioacoustic environments produced by this aircraft operating on a concrete runup pad for six engine/power configurations. Near-field data are reported for eleven locations in a wide variety of physical and psychoacoustic measures: overall and band sound pressure levels, C-weighted and A-weighted sound levels, preferred speech interference level, perceived noise level, and limiting times for total daily exposure of personnel with and without standard Air Force ear protectors. Far-field data measured at 19 locations are normalized to standard meteorological conditions and extrapolated from 75-8000 meters to derive sets of equal-value contours for these same seven acoustic measures as functions of angle and distance from the source. Refer to Volume 1 of this handbook, 'USAF Bioenvironmental Noise Data Handbook, Vol 1: Organization, Content and Application', AMRL-TR-75-50(1) 1975, for discussion of the objective and design of the handbook, the types of data presented, measurement procedures, instrumentation, data processing, definitions of quantities, symbols, equations, applications, limitations, etc. GRA

HYDROGEN HOLLOW CATHODE ION SOURCE Patent
Michael J. Mirtich, Jr., James S. Sovey, and Robert F. Roman, inventors (to NASA) Issued 19 Aug. 1980 4 p Filed 23 Oct. 1978 Supersedes N79-10894 (17 - 01, p 0118)
(NASA-Case-LEW-12940-1; US-Patent-4,218,633; US-Patent-Appl-SN-953391; US-Patent-Class-313-362; US-Patent-Class-313-231.4) Avail: US Patent and Trademark Office CSCL 20H

A source of hydrogen ions is disclosed and includes a chamber having at one end a cathode which provides electrons and through which hydrogen gas flows into the chamber. Screen and accelerator grids are provided at the other end of the chamber. A baffle plate is disposed between the cathode and the grids and a cylindrical baffle is disposed coaxially with the cathode at the one end of the chamber. The cylindrical baffle is of greater diameter than the baffle plate to provide discharge impedance and also to protect the cathode from ion flux. An anode electrode draws the electrons away from the cathode. The hollow cathode includes a tubular insert of tungsten impregnated with a low work function material to provide ample electrons. A heater is provided around the hollow cathode to initiate electron emission from the low work function material.

A microwave afterglow mass spectrometer apparatus is used to determine the dependence on electron temperature T sub e of the recombination coefficients alpha sub n of the dimer and trimer ions of the series CO+.(CO) sub n. It is found that alpha sub 1 = (1.3 + or - 0.3)x 0.000001 (T sub e(K)/300) to the -0.34; and alpha sub 2 = (1.9 + or - 0.4)x 0.000001 (T sub e(K)/300) to the -0.33 cu cm/sec. These dependences on T sub e are quite different from those obtained previously for polar-cluster ions of the hydronium and ammonium series but are similar to that for simple diatomic ions. M.G.

ION CHEMISTRY IN INTERSTELLAR SPACE Final Report
Michael T. Bowers 30 Sep. 1980 4 p refs
(Contracts NAS7-100; JPL-955623)
(NASA-CR-163580; JPL-9950-417) Avail: NTIS HC A02/MF A01 CSCL 20H

The temperature dependence of the bimolecular reactions of Cl(+), HCl(+), CH(+), CH2(+), N(+), NH(+), and NH2(+) reacting with H2 have been investigated. For Cl(+) and HCl(+) rate constants have been determined over the temperature range of 150 to 400 K. Preliminary data have been obtained for the other systems. The Cl(+)/H2 system shows a weak, but significant positive temperature dependence that could be important in interstellar modeling studies. The HCl(+)/H2 system shows a substantial negative temperature dependence with the rate constant approaching the collision rate at low temperatures. The association reaction CH3(+) + HCN yields CH3 HCN(+) has been theoretically modeled using statistical phase space theory. Both radiative and collisional stabilization have been included. The results are compared with experiment with good agreement obtained over wide variations in T and p. This system is potentially important in the mechanism of large molecule synthesis in interstellar space. Author

TABLES OF STARK LEVEL TRANSITION PROBABILITIES AND BRANCHING RATIOS IN HYDROGEN-LIKE ATOMS
K. Omidvar Sep. 1980 50 p refs Submitted for publication
(NASA-TM-82015) Avail: NTIS HC A03/MF A01 CSCL 20H

The transition probabilities which are given in terms of n prime k prime and n k are tabulated. No additional summing or averaging is necessary. The electric quantum number k plays the role of the angular momentum quantum number l in the presence of an electric field. The branching ratios between stark levels are also tabulated. Necessary formulas for the transition probabilities and branching ratios are given. Symmetries are discussed and selection rules are given. Some disagreements for some branching ratios are found between the present calculation and the measurement of Mark and Wierl. The transition probability multiplied by the statistical weight of the initial state is called the static intensity J sub S, while the branching ratios are called the dynamic intensity J sub D. (Contract DE-AS02-76ER-02892)
(COO-2892-18) Avail: NTIS HC A03/MF A01

A strong 304 A fluorescent signal from He(+) (n = 2) was observed as a function of incident photon wavelength; strong autoionizing structure arising from 3n(+) states are seen in the spectrum. Measurements of the radio of photoproduced Ne(+) ions to Ne(2+) ions indicate that further calibration of detector response is required. The dissociative photoionization of O2 was measured successfully as a necessary preliminary to measuring the photoionization cross section of atomic oxygen. Experimental apparatus was built to measure the photoelectron angular distribution of atomic cesium. In order to measure rare gas photoionization cross sections to plus or minus 1 percent accuracy, a new gas tight window was developed and second order lines in the laboratory light sources were classified. A new random phase approximation for the theoretical calculation of open or closed shell atom photoionization cross sections was developed. DOE

THREE DIMENSIONAL CALCULATION OF ELECTRON ENERGY LOSS IN A VARIABLE PARAMETER FREE-ELECTRON LASER
A. Luccio and C. Pellegrini Mar. 1980 30 p refs
(Contract EY-76-C-02-0016)
(BNL-27598) Avail: NTIS HC A03/MF A01

The effect on the laser efficiency of the electron transverse motion is studied and the electron energy loss is evaluated for a beam having a spread in angle and in the transverse position at the wiggler entrance. The complete three dimensional equations of motion for an electron interacting with the laser field and the wiggler field are integrated numerically. Only the case of a small gain regime, assuming that the laser field intensity remains constant, is considered. The case of a helical wiggler is specifically addressed. The results are compared with the one dimensional model. The effect of the initial position and angular spread can, to a good approximation, be considered equivalent to an increase in the energy spread. The limits for this increased energy spread that must not be exceeded in order to avoid a loss in efficiency are nearly the same as in the one dimensional model. DOE

DIOCOTRON INSTABILITY OF A RELATIVISTIC COAXIAL MULTI-RING HOLLOW ELECTRON BEAM
H. C. Chen and P. J. Palmadesso 18 Aug. 1980 30 p refs
(AD-A088054; NRL-MR-4286) Avail: NTIS HC A03/MF A01 CSCL 20/7

The diocotron stability properties of a relativistic coaxial multiring hollow electron beam are investigated using a macroscopic cold fluid description based on moment-Maxwell equations. It is found that for a broad range of beam parameters and somewhat more general type beam profile the growth rate of instability has a sensitive dependence on fractional charge neutralization, relative position of the rings with conducting wall and gap-length of the rings. In the case of a sharp boundary density profile, the beam can be stabilized easily by a small fractional charge neutralization with appropriate gap length. The growth rate can be either enhanced or reduced depending on the position and gap length of the rings. GRA

ION ENERGY RECOVERY EXPERIMENT BASED ON MAGNETIC ELECTRO SUPPRESSION
J. Kim, W. L. Stirling, W. K. Dagenhart, G. C. Barber, and N. S. Ponte May 1980 32 p refs
(Contract W-7405-eng-26)
(ORNL/TM-7283) Avail: NTIS HC A03/MF A01

A proof of principle experiment on direct recovery of residual hydrogen ions based on a magnetic electron suppression scheme is described. Ions extracted from a source plasma a few kilovolts above the ground potential (approximately 20 A) are accelerated to 40 keV by a negative potential maintained on a neutralizer gas cell. As the residual ions exit the gas cell, they are deflected from the neutral beam by a magnetic field that also suppresses gas cell electrons and then recovered on a ground potential surface. Under optimum conditions, a recovery efficiency (the ratio of the net recovered current to the available full energy ion current) of 80% + or - 20% was obtained. Magnetic suppression of the beam plasma electrons was rather easily achieved; however, handling the fractional energy ions originating from molecular species (H2(+) and H3(+)) proved to be extremely important to recovery efficiency. RERACKING TO INCREASE SPENT FUEL STORAGE CAPACITY, REVISION 1
May 1980 12 p ref
(DOE/SR/SF-2004-Rev-1) Avail: NTIS HC A02/MF A01

Many utilities increased their spent fuel pool storage capacity by replacing aluminum racks having storage densities as low as 0.2 MTU/sq ft with stainless steel racks which can more than

double storage densities. Use of boron-stainless steel racks or thin stainless steel cans containing reassembled fuel rods allows even higher fuel storage densities (up to approximately 1.25 MTU/sq ft). The economics of smaller storage gains that occur if pools, already converted to high density storage, are further reracked are evaluated. DOE

FUSION: AN ENERGY SOURCE FOR SYNTHETIC FUELS
J. A. Fillo, J. Powell, and M. Steinberg 1980 9 p refs Presented at the AIAA Intern. Meeting and Tech. Display, Global Tech. 2000, Baltimore, 6-8 May, 1980
(Contract DE-AC02-76CH-00016)
(BNL-27891; CONF-800590-1) Avail: NTIS HC A02/MF A01

An important first step in the synthesis of liquid and gaseous fuels is the production of hydrogen. Thermonuclear fusion offers an inexhaustible source of energy for the production of hydrogen from water. Depending on design, electric generation efficiencies of approximately 40 to 60 percent and hydrogen production efficiencies by high temperature electrolysis of approximately 50 to 70 percent are projected for fusion reactors using high temperature blankets. Fusion/coal symbiotic systems appear economically promising for the first generation of commercial fusion synfuels plants. Coal production requirements and the environmental effects of large scale coal usage would be greatly reduced by a fusion/coal system. DOE

HYDROGEOLOGIC EFFECTS OF NATURAL DISRUPTIVE EVENTS ON NUCLEAR WASTE REPOSITORIES
S. N. Davis Jun. 1980 41 p refs
(Contract DE-AC06-76RL-01830)
(PNL-2858) Avail: NTIS HC A03/MF A01

Some possible hydrogeologic effects of disruptive events that may affect repositories for nuclear waste are described. A very large number of combinations of natural events can be imagined, but only those events which are judged to be most probable are covered. The disruptive events discussed above are placed into four geologic settings. The geology was generalized from actual field data. The geologic settings considered are: (1) interior salt domes of the Gulf Coast, (2) bedded salt of southeastern New Mexico, (3) argillaceous rocks of southern Nevada, and (4) granitic stocks of the Basin and Range Province. Log-normal distributions of permeabilities of rock units are given for each region. Discussions are devoted to: porosity and permeability of natural materials, regional flow patterns, disruptive events (faulting, dissolution of rock forming minerals, fracturing from various causes, rapid changes of hydraulic regimen); possible hydrologic effects of disruptive events; and hydraulic fracturing. (NASA-Case-MSC-18255-1; US-Patent-4,215,273; US-Patent-Appl-SN-025163; US-Patent-Class-250-347; US-Patent-Class-250-352; US-Patent-Class-250-353; US-Patent-Class-350-55; US-Patent-Class-356-72) Avail: US Patent and Trademark Office CSCL 20F

An optical system for use in a multispectral scanner of the type used in video imaging devices is disclosed. Electromagnetic radiation reflected by a rotating scan mirror is focused by a concave primary telescope mirror and collimated by a second concave mirror. The collimated beam is split by a dichroic filter which transmits radiant energy in the infrared spectrum and reflects visible and near infrared energy. The long wavelength beam is filtered and focused on an infrared detector positioned in a cryogenic environment. The short wavelength beam is dispersed by a pair of prisms, then projected on an array of detectors also mounted in a cryogenic environment and oriented at an angle relative to the optical path of the dispersed short wavelength beam.

CIRCULAR SCAN STREAK TUBE DEVELOPMENT Final Technical Report, May 1976 - Mar. 1979
Scott Nevin Jul. 1980 48 p refs
(Contract NAS5-23525)
(NASA-CR-160029) Avail: NTIS HC A03/MF A01 CSCL 20F

A streak tube having circular scan was designed, built and tested. Continuous circular scan, easily derived from out of phase sine waves applied to the conventional deflection plates, permits the timing of pulses traveling long baselines. At the tube's output a circular array of 720 elements is scanned to provide 30 to 40 picosecond resolution. Initial difficulties with electron bombarded silicon arrays were circumvented by using microchannel plates within the streak tube to provide the needed electronic amplification and digital sensitivity and coupling the 720 element arrays to the electron beam by means of a phosphor on a fiber optics. Two ceramic body tubes with S-20 photocathodes were tested and delivered. Author

ADVANCED PATTERN-MATCHING TECHNIQUES FOR AUTONOMOUS ACQUISITION Quarterly Progress Report, 23 Nov. 1979 - 23 Feb. 1980
P. M. Narendra and J. J. Grabau Mar. 1980 105 p
(Contract DAAK70-79-C-0114)
(AD-A087684; HONEYWELL-80SRC25; QPR-2) Avail: NTIS HC A06/MF A01 CSCL 17/7

The key objective of this effort is the development of pattern-matching algorithms which can impart autonomous acquisition capability to precision-guided munitions such as Copperhead and Hellfire. Autonomous acquisition through pattern matching holds the promise of eliminating laser designation and enhancing fire power by multiple target prioritization. The pattern-matching approach being developed under this program is based on a symbolic pattern-matching framework, which is suited for the autonomous acquisition scenario. It is based on matching a symbolic representation derived from the two images, and it can accommodate the stringent pattern-matching criteria established by the scenario: enormous differences in sensor characteristics and illumination, and scene changes such as target motion and obscuration from one view point to the other. GRA

INFRARED OPTICAL PROPERTIES OF THIN CO, NO, CH4, HC1, N2O, O2, AR, AND AIR CRYOFILMS Final Report, 1 Oct. 1978 - 1 Sep. 1979
J. A. Roux, B. E. Wood, A. M. Smith, and R. R. Plyer AEDC Aug. 1980 87 p refs
(AD-A088269; AEDC-TR-79-81) Avail: NTIS HC A05/MF A01 CSCL 07/5

The infrared spectral transmittance of cryofilms formed by CO, NO, CH4, HC1, N2O, O2, N2, Ar, and air were measured. These films were condensed on a 20 K germanium substrate and ranged in thickness from 0.25 to 15 micrometer; the deposition pressure for the films was 2 x 10 to the -7th power torr. Transmission spectra were obtained for the 500- to 3700/cm wavenumber range using a Fourier transform spectrometer. Values of complex index of refraction (n – n - ik) for the cryodeposits were derived from the experimental data using an analytical model and the nonlinear least-squares method. The analytical model treats the germanium as a thick noninterfering film and the deposit as a thin film. Results from the least-squares method are also compared with a Kramers-Kronig determination of the

real part of the index of refraction. The optical properties (n,k) of such cryofilms are reqiured for predicting the degradation of contaminated, cryogenically cooled optical surfaces. GRA

OPTICAL AND MECHANICAL PROPERTIES OF INFRARED MATERIALS Final Report
Stephen M. Copley Jul. 1980 66 p refs
(Contract F49620-78-C-0065; AF Proj. 2306)
(AD-A088120; AFOSR-80-0632TR) Avail: NTIS HC A04/MF A01 CSCL 20/11

Optical and mechanical properties of various IR transmitting materials were investigated. Of special interest was the possibility of strengthening such materials through the formation of point defect complexes without increasing their IR absorption. A major facility for determining IR absorption was developed. The materials investigated include alkali halides, alkaline earth fluorides, Al-doped ZnSe and doped MgO. It was found that the hardness of ZnSe doped with Al and CaF2 doped with Gd could be increased through thermal treatment, however, the identity of the point defect complex producing this hardening could not be determined. REDUCTION AND ASSESSMENT OF INFRARED BACKGROUND DATA Interim Report
Scott M. Singer, Frederick G. Smith, Timothy J. Rogne, and Richard A. Steinberg 7 Aug. 1980 76 p refs
(Contract N00173-79-C-0461; ZF32391003)
(AD-A088241; OMI-80-002; NRL-MR-4284; NRL/EOTPO-62) Avail: NTIS HC A05/MF A01 CSCL 17/5

The outstanding problem in designing passive infrared detection sensors is the design of effective target/background discrimination algorithms. A key factor in the design process is the requirement for a data base of high spatial resolution, low noise, background imagery. The cloud and ocean sunglitter data discussed in this report, obtained by Cincinnati Electronics Co. (CECO), are intended to help satisfy this requirement for infrared (IR) background imagery. We recommend that future IR backgrounds measurements with the CECO radiometer incorporate the following suggestions: the CECO radiometer should be upgraded to incorporate dc restoration; data should be recorded from all 24 detector channels, rather than just 8 channels; tape recorder noise should be decreased by improving the data recording system. GRA

DESIGN AND IMPLEMENTATION OF A FIBER-OPTIC GAMMA-MEASUREMENT SYSTEM
R. P. Reedy and D. W. Crawford 19 May 1980 10 p refs Presented at Intern. Symp. Soc. of Photo-Opt. Instr. Engr., San Diego, Calif. 28 Jul. - 1 Aug. 1980 Submitted for publication (Contract W-7405-eng-48)
(UCRL-84109) Avail: NTIS HC A02/MF A01

The downhole portion of a measuring system for gamma rays is described. Three alternative designs are presented for radiation-resistant collimating and condensing lenses, sample cells, turning mirrors, and fiber-optic termination techniques. Mechanical mounts and positioners, shielding, alignment, test methods, and field installation are also discussed. Some general design suggestions for optical systems in adverse environments are included. DOE

FIBER OPTIC COMMUNICATION LINKS
R. H. Meyer 1980 20 p Presented at the IMOG Meeting on Subgroup Environ. Testing, Albuquerque, N. M., 20 May 1980 (Contract EY-76-C-04-0789)
(SAND-80-1290C; CONF-800574-1) Avail: NTIS HC A02/MF A01

Fiber optics is a new, emerging technology which offers relief from many of the problems which limited past communications links. Its inherent noise immunity and high bandwidth open the door for new designs with greater capabilities. Being a new technology, certain problems can be encountered in specifying and installing a fiber optic link. A general fiber optic system is discussed with emphasis on the advantages and disadvantages. Finally, a general purpose prototype Sandia communications link is presented. DOE

OPTIMAL THERMIONIC ENERGY CONVERSION WITH ESTABLISHED ELECTRODES FOR HIGH-TEMPERATURE TOPPING AND PROCESS HEATING Final Report
James F. Morris Jul. 1980 33 p refs
(Contract EC-77-A-31-1062)
(NASA-TM-81555; DOE/NASA/1062-6; E-514) Avail: NTIS HC A03/MF A01 CSCL 20I

Applied research-and-technology (ART) work reveals that optimal thermionic energy conversion (TEC) with approximately 1000 K to approximately 1100 K collectors is possible using well established tungsten electrodes. Such TEC with 1800 K emitters could approach 26.6% efficiency at 27.4 W/sq cm with approximately 1000 K collectors and 21.7% at 22.6 W/sq cm with approximately 1100 K collectors. These performances require 1.5 and 1.7 eV collector work functions (not the 1 eV ultimate) with nearly negligible interelectrode losses. Such collectors correspond to tungsten electrode systems in approximately 0.9 to approximately 6 torr cesium pressures with 1600 K to 1900 K emitters. Because higher heat-rejection temperatures for TEC allow greater collector work functions, interelectrode loss reduction becomes an increasingly important target for applications aimed at elevated temperatures. Studies of intragap modifications and new electrodes that will allow better electron emission and collection with lower cesium pressures are among the TEC-ART approaches to reduced interelectrode losses. These solutions will provide very effective TEC to serve directly in coal-combustion

products for high-temperature topping and process heating. In turn this will help to use coal and to use it well. A.R.H.

PARAMETRIC INSTABILITIES OF ELECTRON CYCLOTRON WAVES IN PLASMAS
V. K. Tripathi and C. S. Liu Mar. 1980 21 p refs
(Contracts N00014-77-C-0590; DE-AS05-77DP-40032)
(AD-A087742; PUB-80-160; TR-80-081) Avail: NTIS HC A02/MF A01 CSCL 20/9

We have studied the parametric metabilities of electron cyclotron waves in the Elmo Bumpy Torus (EBT) ring and the large tokamaks eg PLT. In the EBT, the electron cyclotron pump of finite wavenumber k sub o decays into two Bernstein modes at the second harmonic cyclotron layer and can account for the heating of the ring in the intitial phase. The coupling coefficient for this decay vanishes for a dipole pump, whereas the convective threshold with finite k sub o is about 200 W/sq cm. For large Tokamaks, the convective threshold for various decay channels turns out to be about or ~ 200 KW/sq cm at 3mm wavelength. GRA

XUV ALUMINUM SPECTRA OF LASER-PRODUCED PLASMAS Interim Report
G. A. Doschek and U. Feldman 15 Jul. 1980 15 p refs
(RR0110941)
(AD-A088107; NRL-8416) Avail: NTIS HC A02/MF A01 CSCL 07/4

XUV aluminum spectra from 200 to 500 A of laser-produced plasmas are discussed. The plasmas were obtained by focusing Nd:glass and CO2 laser pulses onto planar targets. The spectrograph was a normal incidence instrument without an entrance slit. Therefore monochromatic images of the plasma are formed at the focal plane, rather than spectral lines. Kodak 101 film was used to record the spectra. Images of the plasmas due to transitions in Al V through Al X were identified using a theoretical synthetic aluminum spectrum. The time and space integrated relative numbers of the ions form Al V through Al X can be obtained from a comparison of the synthetic and laser-plasma spectra. The comparison enables determination of the film calibration curve and the efficiency of the instrument with wavelength. The morphology of the expansion of the plasma is also discussed. The plasma of the highest temperature ions (Al X) expands outward in cylindrically shaped structures. The expansion of the lower temperature plasma (such as Al VII) is also cylindrical in appearance, but the images are not as tightly confined to the target normal as for the hotter ions. GRA

PLASMA THEORY AND SIMULATION Quarterly Progress Report, 1 Oct. - 31 Dec. 1979
C. K. Birdsall 31 Dec. 1979 102 p refs
(Contracts N00014-77-C-0578; DE-AS03-76EF-00034; DE-AT03-76ET-53064; W-7405-eng-48)
(AD-A088331; QPR-4) Avail: NTIS HC A06/MF A01 CSCL 20/9

In the last QPR, it was shown that our simulation exhibited strong ion trapping at saturation in the lower-drift-velocity regime with vE less than vti as our model had assumed a constant density and vE drift. The typical total ion momentum (Fig. 1a) and ion kinetic energy (Fig. 1b) are exponentially growing in time in the linear regime. In Fig. 1a, the net ion momentum increases in the negative x direction which is the wave propagation direction. Recall that ions in our model are initially in an electrostatic, steady equilibrium state with the ion diamagnetic drift velocity cancelled by the E x B drift velocity. GRA

Preionization experiments have been performed on a Tokamak by injecting about 80 kW of microwave power at 35 GHz for up to 15 ms. Microwave absorption occurs at the electron cyclotron and upper hybrid resonance frequencies as predicted by theory. Preionization causes substantial (40%) reductions in loop voltage during the initial phase of the Tokamak shot. Flux (volt second) savings with preionization are about 30% in the first 2 ms or about 2% of the total flux expenditure in a Tokamak shot. The plasma current starts 20 microsec earlier and rises 1.4 times more rapidly in the preionized case. Electron densities of 5 x 10 to the 12th power/cu cm can be sustained with only a toroidal magnetic field during microwave injection. The bulk electron temperature in the preionized plasma is about 10 eV although there are indications of higher electron temperatures (50 eV) in the upper hybrid resonance layer. During the early stages of ohmic heating the preionization is effective in decreasing the peak of the radiated power. GRA

We report results of electron cyclotron heating (ECH) experiments in which 80 kW of microwave power from a 35 GHz gyrotron is injected into a Tokamak with large single pass absorption. For 10 ms microwave pulses, incident from the high field side of the torus, the central electron temperature increases from 850 eV to 1250 eV, in agreement with empirical transport code calculations. For the first time in a Tokamak, we demonstrate that electron temperature scales linearly with ECH power. GRA

PSEUDO-SHOCK AS A QUALITATIVE MODEL IN THE INVESTIGATION OF THE INFLUENCE OF WALL ROUGHNESS ON THE PERFORMANCE OF SUPERSONIC MHD GENERATORS Final Report
Pau-Chang Lu Jul. 1980 94 p refs
(Grant AF-AFOSR-0083-79; AF Proj. 2308)
(AD-A088333; UNLMEPCL-80-1; AFOSR-80-0599TR) Avail: NTIS HC A05/MF A01 CSCL 20/9

A preliminary study, based on an extension of Crocco's pseudo-shock model, has been carried out to explain and predict qualitatively the rather gradual pressure rise in a supersonic MHD generator, to account for the influence of wall roughness on the core flow. A system of non-linear ordinary differential equations is formulated for the wall layer and core, with proper electromagnetic conditions enforced at the interface. Extensive numerical experiments are also presented, which demonstrate indeed the qualitative link between the theory of MHD pseudo-shock and the observed pressure ramp caused by rough walls. GRA

CHARGE TRANSFER Interim Report
J. F. Seely and R. C. Elton Aug. 1980 44 p refs
(Contract EX-76-A-34-1010)
(AD-A088228; NRL-MR-4317) Avail: NTIS
HC A03/MF A01 CSCL 20/9

A method is described whereby a partner in a binary charge transfer process is photon-excited to a state in which the process can proceed at a greatly enhanced rate. The excited state may be real ('resonance-enhancement') or virtual. With the former, radiative decay fluorescent emission indicates directly the initial state density. Similarly, excited product decay indicates the reaction rate. With known cross sections, this can yield the density of the other reactant under conditions localized in both space and time by the inducing laser pulse. Numerous examples directly applicable to fusion devices are indicated. GRA

NUMERICAL MODELLING OF AN END-PLUGGED THETA PINCH
R. D. Milroy and L. C. Steinhauer Apr. 1980 43 p refs
Submitted for publication
(Contract DE-AC06-76ET-53027)
(MSNW-80-1146-2) Avail: NTIS HC A03/MF A01

Analytical and numerical studies of an end plugged theta pinch are described. The analytical mode treats the ablated plug plasma in the quasistatic limit where radiation losses balance energy flowing from the main plasma. This model is used to calculate the enhancement in energy confinement due to an ablating end plug for various plug species. The numerical model employs a one dimensional, time dependent magnetohydrodynamic code. Results of calculations simulating the Scylla 4-P end plugged theta pinch experiment are presented. The calculations achieved reasonable agreement with experiment except for certain notable discrepancies, believed to spring from two dimensional effects. DOE

Electron heat flux in a fully ionized gas between two parallel boundaries, separated by a distance L, is studied. Two full range moment methods with the assumption of a two sided distribution function are employed to analyze the relation between the electron heat flux and the plasma collisionality parameter L/lambda/sub ei/, both with and without electron-electron collisions (lambda/sub ei/, is the electron-ion collision mean free path). The electron heat flux compared to free convective flux and the continuum heat flux is determined as a function of L/lambda/sub ei/, over the entire range from free flow to continuum regimes. DOE

THEORY OF FIELD-REVERSED MIRRORS AND FIELD-REVERSED PLASMA-GUN EXPERIMENTS
D. V. Anderson, S. P. Auerbach, H. L. Berk, J. K. Boyd, T. A. Brengle, J. A. Byers, B. I. Cohen, W. C. Condit, J. C. Eddleman, R. P. Freis et al. 22 May 1980 18 p refs Presented at 8th Intern. Conf. on Plasma Phys. and Controlled Nucl. Fusion Res., Brussels, 1-10 Jul. 1980 Prepared in cooperation with California Univ., Berkeley, Lawrence Berkeley Lab., Illinois Univ., Urbana, and New York Univ., N. Y. Submitted for publication
(Contract W-7405-eng-48)
(UCRL-83518; CONF-800707-6; IAEA-CN-38/R-2) Avail: NTIS HC A02/MF A01

Experimental and theoretical studies of field reversal in a mirror machine are reported. Plasma gun experiments demonstrate that reversed field plasma layers are formed. Low energy plasma flowing behind the initially produced plasma front prevents tearing of the layer from the gun muzzle. MHD simulation shows that tearing can be obtained by impeding the slow plasma flow with a plasma divider. It is demonstrated theoretically that a field reversed mirror imbedded in a multipole field can be sustained in steady state with neutral beam injection even in the absence of impurities. MHD stability analysis shows that growth rates of elongated reversed field theta pinch configurations decrease with axial extension, which indicates the importance of including finite Larmor radius in the analysis. Tilting mode criteria are dramatically improved by proper shaping, and a problimak shape is proposed. Tearing mode stability of reversed field theta pinches is greatly enhanced by flux exclusion. Self-consistent, 1-1/2 dimensional transport codes were developed, and initial results are presented. DOE

NONLINEAR ION-CYCLOTRON WAVES IN MIRROR MACHINES
B. I. Cohen, G. R. Smith, H. L. Berk, J. A. Byers, J. F. Clauser, D. L. Correll, A. H. Futch, R. K. Goodman, D. P. Grubb, and L. L. LoDestro 22 May 1980 13 p refs Presented at 8th Intern. Conf. on Plasma Phys. and Controlled Nucl. Fusion Res., Brussels, 1-10 Jul. 1980; sponsored by International Atomic Energy Agency Prepared in cooperation with Rochester Univ., N.Y. Submitted for publication
(Contract W-7405-eng-48)
(UCRL-83517; CONF-800707-4; IAEA-CN-38/S-1) Avail: NTIS HC A02/MF A01

Experimental results on ion cyclotron waves observed in the 2XIIB mirror machine are reviewed, and relevant theoretical work is discussed. The work reported generally substantiates the quasilinear diffusion model of mirror plasma confinement, but also suggests alternatives. The end loss current required by theory of the drift-cyclotron loss-cone (DCLD) instability agrees with

measurements of this current. The experiment indicates that an increased ratio of plasma radius to ion gyroradius improves plasma confinement. However, measurements sometimes show a second ion-cyclotron mode, which is not the DCLC mode. Theoretical work on loss-cone instabilities has concentrated on linear, quasilinear, and fully nonlinear models of increased sophistication and experimental applicability. DOE

OPTICAL COATINGS FOR LASER FUSION APPLICATIONS
W. H. Lowdermilk, D. Milam, and F. Rainer 24 Apr. 1980 28 p refs Presented at the Intern. Conf. on Met. Coatings, San Diego, Calif., 21-25 Apr. 1980 Submitted for publication
(Contract W-7405-eng-48)
(UCRL-83582; CONF-800439-7) Avail: NTIS HC A03/MF A01

Lasers for fusion experiments use thin-film dielectric coatings for reflecting antireflecting and polarizing surface elements. Coatings are most important to the Nd:glass laser application. The most important requirements of these coatings are accuracy of the average value of reflectance and transmission, uniformity of amplitude and phase front of the reflected or transmitted light, and laser damage threshold. Damage resistance strongly affects the laser's design and performance. The success of advanced lasers for future experiments and for reactor applications requires significant developments in damage resistant coatings for ultraviolet laser radiation. DOE

LARGE ASPECT RATIO TOKAMAK STUDY
R. L. Reid, J. A. Holmes, W. A. Houlberg, Y. K. M. Peng, D. J. Strickler, T. G. Brown (Grumman Aerospace Corp.), and G. W. Wiseman (Grumman Aerospace Corp.) Jun. 1980 57 p refs
(Contract W-7405-eng-26)
(ORNL/TM-7278) Avail: NTIS HC A04/MF A01

The potential for producing a viable longburn Tokamak reactor by enhancing the volt second capability of the ohmic heating transformer through the use of high aspect ratio designs was investigated. The plasma physics, engineering, and economic implications of high aspect ratio Tokamaks were assessed in the context of extended burn operation. Using a one dimensional transport code, plasma startup and burn parameters were addressed. The pulsed electrical power requirements for the poloidal field system, which have a major impact on reactor economics, were minimized by optimizing the startup and shutdown portions of the Tokamak cycle. A representative large aspect ratio Tokamak with an aspect ratio of 8 was found to achieve a burn time of 3.5 h at capital cost only approximately 25% greater than that of a moderate aspect ratio design Tokamak. DOE

ELECTROMAGNETIC INSTABILITIES IN COLLISIONLESS PLASMAS
G. Laval, R. Pellat, and M. Vuillemin May 1980 38 p refs Transl. into ENGLISH from French report CN-21/71 p 259-276 Sponsored by DOE Prepared for California Univ., Lawrence Livermore Lab.
(UCRL-Trans-11593; CN-21/71) Avail: NTIS HC A03/MF A01

The stability of inhomogeneous collisionless plasmas with respect to electromagnetic perturbations is studied. The macroscopic equilibrium parameters depend on a single coordinate of an orthogonal system. The current carried by the particles of the plasma is directed along another coordinate axis. The perturbations considered are constant along the current lines. In plane geometry, for example, the distribution functions of the particles depend only on the energy and on the moment along OZ of the Hamiltonian of a particle. The equilibrium is inhomogeneous along OX and the perturbations are invariant with respect to OZ. A Lyapunov function is constructed. DOE

FUSION REACTOR BLANKET/SHIELD DESIGN STUDY
D. L. Smith, R. G. Clemmer, S. D. Harkness, J. Jung, J. L. Krazinski, R. F. Mattas, H. C. Stevens, C. K. Youngdahl, C. Trachsel (McDonnell Douglas Astronautics Co., St. Louis), and D. Bowers (McDonnell Douglas Astronautics Co., St. Louis) Jul. 1979 426 p refs Prepared in cooperation with McDonnell Douglas Astronautics Co., St. Louis
(Contract W-31-109-eng-38)
(ANL/FPP-79-1) Avail: NTIS HC A19/MF A01

A joint study of Tokamak reactor first wall/blanket/shield technology was conducted to identify key technological limitations for various tritium breeding blanket design concepts, establishment of a basis for assessment and comparison of the design features of each concept, and development of optimized blanket designs. The approach used involved a review of previously proposed blanket designs, analysis of critical technological problems and design features associated with each of the blanket concepts, and a detailed evaluation of the most tractable design concepts. Tritium breeding blanket concepts were evaluated according to the proposed coolant. The effort concentrated on evaluation of lithium and water cooled blanket designs and helium and molten salt cooled designs. Generalized nuclear analysis of the tritium breeding performance, an analysis of tritium breeding requirements, and a first wall stress analysis were conducted as part of the study. The impact of coolant selection on the mechanical design of a Tokamak reactor was evaluated. Reference blanket designs utilizing the four candidate coolants are presented. DOE

STUDY OF FLOW AND LOSS PROCESSES AT THE ENDS OF A LINEAR THETA PINCH Progress Report, 1 Jun. 1979 - 30 Sep. 1980
Thomas M. York and Edward H. Klevans May 1980 68 p refs
(Contracts DE-AS02-76ET-53018; EY-76-S-02-4020)
(COO-4020-10) Avail: NTIS HC A04/MF A01

Experimental and analytical studies of particle and energy loss at the ends of a linear theta pinch was carried out. A study of transients occurring in the formation of reversed trapped fields within the coil, and of transients in the end region of a 25 cm long device was completed. A 1-D code proved to be highly accurate in describing loss events and defining transport

mechanisms in different experiments and is described here. A study of loss along field lines in a 50 cm long device generated new information on loss velocity, axial and radial temperature gradients, and established an initial effort in understanding thermal loss to the walls. Rotation and parallel trapped fields were added to the existing 0-D code. A new technique crowbar switch and magnetic field prediction code was developed. Direct measurement of electron velocity with Thomson scattering was accomplished experimentally. DOE

Preliminary calculations of Q and magnet designs are presented for three different versions of tandem mirror reactors (TMR) using thermal barriers to enhance plug potentials by auxiliary electron heating. These three versions called A-cell-barrier TMR, axisymmetric-barrier TMR, and inside-barrier TMR, exhibited reduced plug density and less required magnetic mirror field compared to TMR designs without thermal barriers. ELECTROSTATIC LEVITATION AND TRANSPORT OF LASER FUSION TARGETS
Wayne L. Johnson and Charles D. Hendricks 22 May 1980 10 p refs Presented at IEEE/IAS 1980 Annual Meeting, Cincinnati, 28 Sep. - 2 Oct. 1980 Submitted for publication
(Contract W-7405-eng-48)
(UCRL-83981; CONF-800914-2) Avail: NTIS HC A02/MF A01

Several levitation concepts were evaluated resulting in the electrostatic quadrupole being chosen as the most universal. A levitator was constructed to handle laser fusion targets during quadrupole rail which was segmented to provide electrically controlled transport and confinenment along the rail. This device demonstrated transport both vertical and horizontal of targets with appropriate mass to size ratios and remarkably stable confinement at atmospheric pressure. DOE

REVERSED-FIELD PINCH FUSION REACTOR
R. L. Hagenson and R. A. Krakowski (LASL, N. Mex.) 1980 14 p refs Presented at 15th Intersoc. Energy Conversion Eng. Conf., Seattle, 18-22 Aug. 1980
(Contract W-7405-eng-36)
(LA-UR-80-1494; CONF-800806-4) Avail: NTIS HC A02/MF A01

A conceptual engineering design of a fusion reactor based on plasma confinement in a toroidal reverse field pinch (RFP) configuration is described. The plasma was ohmically ignited by toroidal plasma currents which also inherently provided the confining magnetic fields in toroidal chamber. The 5-s dwell period between burn pulses for plasma quench and refueling allowed steady-state operation of all thermal systems outside the first wall; no auxiliary thermal capacity was required. A borated-water shield was located immediately outside the thermal blanket to protect the superconducting magnet coils. Both the superconducting poloidal and toroidal field were coils energized by homopolar motor/generators. Accounting for all major energy sinks yielded a cost-optimized system with a recirculating power fraction of 0.17; the power outputs is 750 MWe(net). DOE

SYSTEMS ASSESSMENT OF HEAVY ION BEAM FUSION DRIVERS Final Report, 1 Jan. 1978 - 31 Dec. 1979
T. Kammash, C. R. Drum, and R. D. Theisen May 1980 44 p refs
(Contract DE-AC08-79DP-40039)
(DOE/DP-40039) Avail: NTIS HC A03/MF A01

A systems analysis for a fusion reactor utilizing a heavy ion beam pellet fusion is carried out to evaluate the performance of several potential drivers. These include: hearthfire reference concepts 2 and 3; the RF linear accelerator; and the induction linac system. Accelerator systems utilizing rapid cycling synchrotrons are shown to be the least attractive drivers unless the efficiency of this component is sufficiently improved. Using a power cost formula that accounts for the accelerator operating cost it appears on the basis of available data that only one driver might fall within the economically acceptable range of producing electric power at 4 cents a kilowatt hour if certain optimistic conditions are met. INITIAL REVERSED-FIELD PINCH EXPERIMENTS ON ZT-40 AND RECENT ADVANCES IN RFP THEORY
D. A. Baker, C. J. Buchenauer, L. C. Burkhardt, T. E. Cayton, E. J. Aramana, G. I. Chandler, R. S. Christian, R. Dagazian, J. M. DiMarco, and J. N. Downing 1980 14 p refs Presented at the IAEA 8th Intern. Conf. on Plasma Phys. and Controlled Nucl. Fusion Res., Brussels, 1 Jul. 1980
(Contract W-7405-eng-36)
(LA-UR-80-1834; CONF-800707-11) Avail: NTIS HC A02/MF A01

The ZT-40 reversed field pinch was operated in several modes. An analytic ohmic heating and ignition model both confirm and provide guidance for transport codes. Nondissipative formation schemes were analyzed and ideal MHD stable evolution and burn scenarios were found. Particle and fluid simulations have produced qualitative agreement with respect to the nonlinear behavior of m = 0 resistive g modes. Helical ohmic reversed field states are produced by a 2D dynamical simulation, and nonlinear analytic work describes the final state. A fast resistive MHD code for linear stability has clarified the relations between several kinds of resistive instabilities. Ballooning modes and g modes in systems with arbitrary magnetic shear including resistivity and viscosity, were studied in a unified treatment with growth rate vs wavenumber showing the existence of important cutoffs. (Contract W-7405-eng-36)
(LA-UR-80-1826; CONF-800707-12) Avail: NTIS HC A03/MF A01

Two types of compact toroids have been studied: Spheromaks and field reversed configurations. Spheromaks, which contain both toroidal and poloidal fields, have been formed with a magnetized coaxial injector and trapped in both prolate and oblate flux conservers. As expected from theory, the prolate configuration always tilts, but the oblate configuration can be made stable even in the presence of a guide field. Theoretical studies of the FRC (no toroidal field) have been compared with the results of two field reversed theta-pinches, FRX-A and FRX-B. DOE

Conf. on Plasma Phys. and Controlled Nucl. Fusion Res., Brussels, 1-10 Jul. 1980 Prepared in cooperation with California Univ. Berkeley, Lawrence Berkeley Lab. and New York, Univ. Submitted for publication
(Contract W-7405-eng-48)
(UCRL-83518-Rev-1; CONF-800707-6-Rev-1;
Paper-IAEA-CN-38/R-2) Avail: NTIS HC A02/MF A01

Experimental and theoretical studies of field reversal in a mirror machine are reported. Plasma-gun experiments demonstrate that reversed field plasma layers are formed. Low energy plasma flowing behind the initially produced plasma front prevents tearing of the layer from the gun muzzle. MHD simulation shows that tearing can be obtained impeding the slow plasma flow with a plasma divider. It is demonstrated theoretically that a field reversed mirror imbedded in a multipole field can be sustained in steady state with neutral-beam injection even in the absence of impurities. MHD stability analysis shows that growth rates of elongated reversed field theta pinch configurations decrease with axial extension, which indicates the importance of including finite Larmor radius in the analysis. ESTIMATION RATE CONSTANTS FOR DIFFUSION-CONTROLLED INTERMACROMOLECULAR REACTIONS AT INFINITE DILUTION

Kazuyuki Horie and Itaru Mita Jun. 1980 13 p refs

(ISAS-580-Vol-45-No-5; ISSN-0372-1418) Avail: NTIS HC A02/MF A01

The mechanism of diffusion-controlled macromolecular reaction and chain dynamics in polymer reactions is examined. Termination between growing polymer radicals in free-radical polymerization and energy transfer between photo-excited species attached to polymer chains are included. The estimation of k sub q at infinite dilution uses several methods based on thermodynamic and hydrodynamic interaction parameters between polymer and solvent. Molecular-weight and solvent-power dependencies of the resulting k sub q at infinite dilution are discussed. S.F.

A MIXED BONDING BAND STRUCTURE CALCULATION FOR Gas AND AlAs, USING THE APW-k VECTOR p VECTOR METHOD

A. Ferreira daSilva, I. C. daCunhaLima, and N. J. Parada Jun. 1980 22 p refs Submitted for publication

(INPE-1762-RPE/151) Avail: NTIS HC A02/MF A01

The band structure of GaAs in a mixed covalent and ionic bonding was obtained. The energy levels at the gamma point are also obtained for AlAs. The ionicity is introduced as a parameter into the crystalline potential. The dependence of the energy levels and the momentum matrix elements on the values of the ionicity was studied. The value of the ionicity which gave the direct gap Eg = 1.52 eV for GaAs (the accepted experimental value) was found to be 0.1, and for AlAs Eg = 2.50 eV was obtained for an ionicity of 0.2. Author

THE HUBBARD MODEL FOR THE DISORDERED SYSTEMS: IN APPLICATION TO THE SPECIFIC HEAT OF THE PHOSPHORUS-DOPED SILICON

A. Ferreira daSilva, R. Kishore, and I. C. daCunhaLima Aug. 1980 28 p refs Submitted for publication

(INPE-1862-RPE/212) Avail: NTIS HC A03/MF A01

A self consistent many body theory of the disordered systems, described by the Hubbard Hamiltonian with random transfer integral was developed. The random nature of the system was taken into account by the Matsubara-Toyozawa theory of impurities in semiconductors. By considering the hydrogen like impurity states, the electronic specific heat of the uncompensated phosphorus doped silicon was calculated and compared with the experimental results. It was found that it agreed well with the experiment in the entire semiconductor to the dilute metallic region. T.M.

A STUDY OF METAL-SEMICONDUCTOR CONTACTS ON INDIUM PHOSPHIDE Annual Report, 1 Feb. - 30 Sep. 1979

G. Y. Robinson Griffiss AFB, N.Y. RADC May 1980 55 p refs

(Contract F19628-79-C-0016; AF Proj. 2306)

(AD-A087666; RADC-TR-80-108) Avail: NTIS HC A04/MF A01 CSCL 20/12

This report describes the research accomplished during the first eight months of a 20 month program of research on metal semiconductor contacts to indium phosphide (InP). The Schottky barrier energy Phi sub B and contact resistance are correlated to the metallurgical behavior of metal/InP contacts by using Auger electron spectroscopy. A carefully processed set of samples were used to show conclusively that Phi sub B is greater on p-type InP than on n-type InP. This is shown to be the opposite from the behavior of GaAs and Si Schottky diodes fabricated at the same time using the same process. Several metallic structures have been investigated for use as ohmic contacts to InP. A Ni/Au/Ge system is shown to provide low resistance contacts to n-type InP after heat treatment. For ohmic contact to p-type InP, two metal systems have been tested, but neither system has proven to be suitable for practical InP devices as of yet. Low resistance contacts are found with heat treated Au/Mg contacts, however, the contact surfaces are nonuniform. Pd was substituted for Au in the Au/Mg contact in order to reduce In-Au alloying. Preliminary results indicate that the contact resistance of the Pd/Mg contacts is high. This may result from MgO formation at the critical InP, interface during contact fabrication. GRA

Graphoepitaxy is a technique that uses artificial surface relief structures to induce crystallographic orientation in thin films. A simple model for graphoepitaxy is presented which predicts materials that can be deposited on smooth amorphous substrates to produce a crystalline texture can be uniformly oriented by appropriate surface relief structures. Graphoepitaxy was used to achieve uniformly oriented silicon films 0.5 micron m thick over surface relief gratings etched into amorphous fused silica substrates. The silicon was first deposited as an amorphous film

and then crystallized using a scanned Ar laser beam. The mean [100] directions in the silicon were parallel to the grating and perpendicular to the substrate plane. Films uniformly doped with phosphorous (2.4 x 10 to the 17th power atoms/cu cm) had an electron mobility at least 40% of the bulk value. GRA

The growth of Si single crystal films by solid phase epitaxy (SPE) is reported. Direct SPE and silicide-interlayer SPE, in which a transition metal film is deposited onto the substrate and reacted with it prior to the deposition of amorphous Si, are discussed. It is shown that previous work on silicide-interlayer SPE was dominated by contaminant effects and did not represent the intrinsic behavior of the process. However, conducting interlayer SPE in a noncontaminating, ultrahigh vacuum environment did not improve the quality of the films, but instead changed the growth morphology, with the result that even films grown under the most stringent vacuum conditions are unsuitable for most microelectronic applications. The direct SPE of Si deposited onto a clean substrate is shown to produce high-quality epitaxial films on Si < 100 >. MOS transistors fabricated in SPE layers grown at 550 C functioned identically to their bulk Si counterparts. Several sources of contaminant introduction in SPE are discussed, and their effects on the growth morphology and crystal quality are reported. M.G.

The attenuation and transverse acoustoelectric voltage arise out of coupling of the electric field accompanying a surface acoustic wave propagating on a piezoelectric substrate and the carriers in an adjacent semiconductor. These phenomena are useful in the study of the electronic properties of semiconductor surfaces and this nondestructive technique to evaluate the effects of Si wafer processing methods. The contactless nature of this method makes it possible to recharacterize the same wafer after repeated processing steps without fear of contaminating furnaces and other processing equipment. The phenomena are analyzed theoretically and the results used to interpret the data obtained for the experimental measurement of important wafer properties. The conductivity, surface carrier type and time constants associated with the emission and capture of carriers in surface traps are determined for silicon. The results are compared with those obtained from four point probe and C-V measurements. GRA

RAPID SOLIDIFICATION PROCESSING: AN OUTLOOK Technical Report, Oct. 1978 - Jan. 1980
M. Cohen, B. H. Kear (United Technologies Research Center, East Hartford, Conn.), and R. Mehrabian (NBS, Washington, D.C.) 11 Aug. 1980 25 p refs Presented at the 2d Conf. on Rapid Solidification Processing Principles and Technol., Reston, Va., 23-26 Mar. 1980 Prepared in cooperation with United Technologies Research Center, East Hartford, Conn. Sponsored in part by NBS
(Contracts N00014-76-C-0171; N00014-78-C-0387; F33615-76-C-5136; DARPA Order 3751; NR Proj. 031-795)
(AD-A088473; TR-7) Avail: NTIS HC A02/MF A01 CSCL 13/8

The elements of rapid solidification processing (RSP) are highlighted from the standpoints of (a) the fundamentals involved, (b) the prospects for new structure/property relationships, and (c) the interplay between materials processing and the wider field of materials science and engineering. Prototype methods of rapid solidification and consolidation are briefly described. Particular attention is then given to various solidification modes and resulting morphologies as a function of cooling rate from the molten state. These modes span the range of planar, cellular, dendritic, and segregationless (microcrystalline), solidification, the latter being achieved by critical or hypercritical undercooling. The need for careful characterization of RSP microstructures is emphasized, and important scientific challenges for advancing the field of RSP are stressed. GRA

EVIDENCE FOR AN OXYGEN INTERMEDIATE IN THE

CATALYTIC REDUCTION OF NO BY CO ON RHODIUM SURFACES
L. H. Dubois, P. K. Hansma, and G. A. Somorjai 29 Jul. 1980 29 p refs Submitted for publication Sponsored in part by DOE Prepared in cooperation with California Univ., Santa Barbara
(Contract N00014-78-C-0011; NR Proj. 056-673)
(AD-A088045; TR-5) Avail: NTIS HC A03/MF A01 CSCL 07/4

Evidence for an oxygen intermediate in the reaction of NO and CO to form N2 and CO2 over rhodium surfaces is presented. High resolution electron energy loss spectroscopy (ELS) measurements indicate that both NO and CO molecules associatively adsorb on the Rh(331) single crystal surface at 300 K. Chemisorbed NO readily dissociates on this surface upon heating at 450 K. At 700 K high resolution ELS and Auger electron spectroscopy (AES) both indicate that only oxygen is present on the catalyst surface. N2 desorption below this temperature is easily detected by mass spectroscopy. The addition of CO to this surface oxygen at 700 K results in the formation of gaseous CO2 and the removal of the surface oxygen species. Similar results were obtained when O2 was substituted for NO as a control indicating that oxygen is indeed a surface intermediate under our experimental conditions. GRA

Thermal energy molecular beams have been used to study chemical interactions with metal surfaces. Chemisorption of simple molecules such as H2, O2, CH4, C2Hx and CO was investigated on single and polycrystalline surfaces of Pt, Ni, Co, and Ag. Kinetic parameters and reaction mechanisms were determined for model catalytic reactions including CO and C2Hx oxidation and methanation from H2/CO mixtures. Chemical reactions of NOx with CO and D2 on Pt(111) and other surfaces have been surveyed and the kinetics of NO and O2 chemisorption have been measured. The theory of adsorption/desorption kinetics is reviewed and certain deficiencies identified. GRA

INITIAL STUDY OF BALLISTIC EFFECTS FOR THE OPERATION OF GaAs FET DEVICES Final Report, Mar. 1979 - Feb. 1980
L. F. Eastman Jul. 1980 19 p refs
(Contract N00014-79-C-0290; ARPA Order 3720; NR Proj. 243-028)
(AD-A088350) Avail: NTIS HC A02/MF A01 CSCL 20/12

Ballistic electron motion at high velocity in the (100) direction in GaAs at both 77 K and room temperature has been determined by current-voltage data on thin layers. Molecular beam epitaxial abrupt layers .4-.5 microns thick with N- ohmic contacts on both sides, have been tested, and ballistic motion occurs below .5V applied voltage. Layers with a donor density of 1 x 10 to the 15th power/cc, and layers with an acceptor density of 1 x 10 to the 15th power/cc both yield space charge limited current data to agree with the corresponding ballistic transport models developed. Average electron velocity values five times higher than that obtainable in a standard FET are now possible for both 77 K and room temperature in such ballistic electron motion. Although the standard FET geometry, even with short gates, is precluded by thick depletion layers into lightly doped layers, from both the exposed surface and the interface with the semi-insulating substrate, it has been concluded that a ballistic electron transistor with a geometry similar to that of the permeable base transistor is possible for very high speed, high frequency, low noise performance. PERCOLATION AND ELECTRICAL CONDUCTION IN SUPERCONDUCTING COMPOSITES Interim Report
Christopher John Lobb Aug. 1980 129 p refs
(Contracts N00014-77-C-0085; N00014-75-C-0648; Grants NSF DMR-77-24295; NSF DMR-79-04155; NSF DMR-79-09011)
(AD-A088196; TR-10) Avail: NTIS HC A07/MF A01 CSCL 20/3

We report the experimental properties of a number of random superconducting-normal metal composites. Theoretical interpretation is also presented, with emphasis on the effects of geometrical randomness. The electrical properties of in situ multifilamentary Cu-V3Ga wires are discussed, with emphasis on critical current and field properties which are relevant to applications. We found that these wires had upper critical fields as high as 22.4 T at 4.2 K with a transition temperature of 15.5 K. Their overall critical current density compared favorably with commercial wires. The results of electrical measurements on in situ Cu alloy-Nb composites are reported which elucidate the roles of percolation and the proximity effect in these materials. Our data show that the proximity effect is very important in clean, low superconducting concentration samples, with geometrical percolation being more important as the matrix becomes dirtier. In addition, we discuss models for the superconducting to normal transition in these materials which include the effects of randomness and thermal fluctuations. A two dimensional thin film system based on Cu-Pb is discussed and shown to be qualitatively similar to the three dimensional in situ composites. GRA

AUTOMATED X-RAY ORIENTATION FOR QUARTZ CRYSTAL RESONATORS Interim Report, 1 Jul. - 31 Dec. 1979
Robert W. Birrell, Robert J. Valihura, John L. Chambers, Myron A. Pugh, and S. Thomas Workman Jul. 1980 50 p refs

Prepared in cooperation with Advanced Research and Applications Corp., Sunnyvale, Calif.
(Contract DAAK20-79-C-0254; DA Proj. 1L1-62705-AH-94) (AD-A088063; DELET-TR-79-0254-1; IR-1) Avail: NTIS HC A03/MF A01 CSCL 14/2

The major objective of this program is to develop an automated X-ray orientation system which is capable of measuring the angles of cut of doubly rotated cuts of quartz (SC cut) to seconds of arc on a production basis. Precise measurement of Laue spots is used in conjunction with laser crystal surface measurements to determine the angle of cut. The entire procedure is under control of a dedicated minicomputer. A second objective is to angle correct the measured crystals. Several techniques are being studied to replace the conventional laboratory type correction procedure. GRA

A-15 SUPERCONDUCTING COMPOSITES IN THE 0.1 MICRON REGION
D. K. Finnemore and J. D. Verhoeven 1980 16 p refs Presented at the Intern. Cryogenic Mater. Conf., Madison, Wis., 21 Aug. 1980
(Contract W-7405-eng-82)
(IS-M-274; CONF-800816-1) Avail: NTIS HC A02/MF A01

Consumable electrode arc casting procedures were used to produce 10 kg billets Cu-Nb alloys. The resulting dendrite morphology and homogeneity is suitable for industrial scale production of Nb3Sn-Cu multifilamentary superconducting wire for magnets in the 8 to 14 Telsa range. If proper heat flow patterns can be maintained, the same techniques should be suitable for 100 kg billets. In the design of these composites for magnet wire, a Cu70Nb30 casting is a good choice of Nb content if high J/sub c/ and ease of fabrication are the major considerations. If unusual strain tolerance is the primary consideration, then a lower Nb and lower Sn content is preferred. DOE

OBSERVATION OF AN OPTICAL STARK EFFECT ON VIBRATION AND ROTATIONAL TRANSITIONS
L. A. Rahn, R. L. Farrow, M. L. Koszykowski, and P. L. Mattern Jun. 1980 15 p refs Submitted for publication
(Contract DE-AC04-76DP-00789)
(SAND-80-8707) Avail: NTIS HC A02/MF A01

Vibrational and rotational Raman transitions were shown to be shifted to lower frequencies in the presence of a nonresonant high intensity optical field. Experimental results using CARS spectroscopy for hydrogen and nitrogen are presented. The magnitude of the observed shift is in agreement with a calculation which considered the coupling of the optical field to the internuclear separation via the molecular electronic polarizability. The magnitude of the shift is proportional to the optical field intensity. DOE

SEQUENTIAL PURIFICATION AND CRYSTAL GROWTH FOR THE PRODUCTION OF LOW COST SILICON SUBSTRATES Quarterly Technical Progress Report, 1 Jan. - 31 Mar. 1980
Ming Liaw and F. S. DAragona May 1980 36 p refs Prepared for Midwest Research Inst., Golden, Colo.
(Contract DE-AC02-77CH-00178)
(SERI-8119-3/2; QTPR-2) Avail: NTIS HC A03/MF A01

Direct methods for the purification of MG-Si were used. Sequential steps of purification were followed by crystal growth. The steps of sequential purification included: leaching of MG-Si charge, phase separation of non-soluble impurities from molten silicon, reactive gas treatment of molten silicon, liquid-liquid extracting (called slagging), and impurity redistribution using ingot pulling. All the purification steps were performed in a consecutive manner using a crystal puller. The study of the purification by reactive gas treatment, and slagging was completed. Selection of a reusable crucible was also made. DOE

EFFECTS OF IRRADIATION AND MECHANICAL STRESS ON THE SUPERCONDUCTING PROPERTIES OF CANDIDATE MAGNET CONDUCTORS
C. L. Snead, Jr. and Thomas Luhman 1980 60 p refs
(Contract DE-AC02-76CH-00016)
(BNL-27976) Avail: NTIS HC A04/MF A01

Neutron and charged-particle irradiation effects in NbTi and the A15-compound superconductors were investigated. The utility of these conductors in radiation fields was explored by defining the magnitude of critical-property changes with the fluence of various irradiating particles. The physical mechanisms that couple the irradiation defects to the observed critical-property changes are discussed. Annealing/recovery data on irradiated materials are included where they pertain to the understanding of the physical mechanisms involved, and thereby to the desirability of magnet annealing in actual operating circumstances. STUDY OF GRAIN BOUNDARY SEGREGATION USING THE AUGER ELECTRON EMISSION TECHNIQUE Annual Technical Progress Report, 1 Jan. - 31 Dec. 1979
D. F. Stein, L. A. Heldt, and A. W. Funkenbusch 1980 20 p refs
(Contract DE-AS02-76ER-02166)
(DOE/ER-02166) Avail: NTIS HC A02/MF A01

The influence of grain boundary chemical composition on hydrogen embrittlement was invest ;ated. Auger electron spectroscopy was employed to determine the grain boundary compositions of nickel-copper alloys containing various concentrations of phosphorus and subjected to various thermal treatments. Phosphrous segregates to grain boundaries during slow cooling, accompanied by reduced concentrations of grain boundary copper. Tensile tests were conducted in air and following cathodic charging with hydrogen. All samples tested in air exhibited a completely ductile fracture; ductility was insensitive to grain boundary composition. Fractures of hydrogen-charged samples were brittle and intergranular; elongation to fracture increased significantly with increasing concentration of grain boundary phosphorus. The influence of phorsphorus segregation on embrittlement by hydrogen or by mercury ie analyzed in terms of additive and interactive mechanisms. DOE

SIMULATION OF SHORT-TERM ANNEALING OF DISPLACEMENT CASCADES IN FCC METALS
H. L. Heinisch, D. G. Doran, and D. M. Schwartz (California State Univ., Northridge) 1980 17 p refs Presented at the 10th Intern. Symp. on Effects of Radiation on Mater., Savannah, Ga., 3 Jun. 1980
(Contract DE-AC14-76FF-02170)
(HEDL-SA-2147-FP; CONF-800609-9) Avail: NTIS HC A02/MF A01

Computer models were developed for the simulation of high energy displacement cascades. Defect production functions for use in correlation analysis of radiation effects in fusion reactor materials were generated. In particular, the stochastic cascade annealing simulation code (SCAS) was developed and used to model the short term annealing behavior of simulated cascades in FCC metals. The code is fast enough to make annealing of high energy cascades practical. Sets of cascades from 5 keV to 100 keV in copper were generated by the binary collision code MARLOWE. DOE

ELECTRON TUNNELING INTO SUPERCONDUCTING INDIUM AND LEAD FILMS CONTAINING THE MAGNETIC IMPURITY MANGANESE Ph.D. Thesis
Juine-Kai Tsang 1980 145 p refs
(Contract DE-AC02-76ER-01198)
(DOE/ER-01198/1316) Avail: NTIS HC A07/MF A01

Tunneling measurements of quench-condensed In-Mn and Pb-Mn alloy films were made. The results were compared with Shiba's theory of superconductors containing magentic impurities. The localized excited impurity states predicted by Shiba's theory were observed in both alloys. In addition to s-wave scattering, it was necessary to include P- and D-wave scattering of the conduction electrons in the theory in order to explain the experimental data. Partial agreement between the theory and the experimental data was obtained using phase shifts from band calculation. The results on In-Mn also agree with thermal conductivity data. DOE

ON THE ANALOGY BETWEEN MATHEMATICAL PROBLEMS OF NON-LINEAR FILTERING AND QUANTUM PHYSICS Interim Report
Sanjoy K. Mitter Jun. 1980 67 p refs Submitted for publication
(Grants AF-AFOSR-3321-77; AF-AFOSR-3281-77; AF Proj. 2304)
(AD-A088077; LIDS-P-1006; AFOSR-80-0583TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

The main thesis of this paper is that there are striking similarities between the mathematical problems of stochastic system theory, notably linear and nonlinear filtering theory, and mathematical developments underlying quantum mechanics and quantum field theory. Thus the mathematical developments of the past thirty years in functional analysis, lie groups and lie algebras, group representations, and probabilistic methods of quantum theory can serve as a guide and indicator to search for an appropriate theory of stochastic systems. In the current state of development of linear and nonlinear filtering theory, it is best to proceed by 'analogy' and with care, since 'unitarity' which plays such an important part in quantum mechanics and quantum field theory is not necessarily relevant to linear and nonlinear filtering theory. The partial differential equations that arise in quantum theory are generally wave equations, whereas the partial differential equations arising in filtering theory are stochastic parabolic equations. Nevertheless the possibility of

passing to a wave equation by appropriate analytic continuation from the parabolic equation, reminiscent of the current program in euclidean field theory, should not be overlooked. GRA

A formal, generic description of decision support systems is introduced. This description views a decision support system as having three principal components: a language system, a knowledge system and a problem processing system. Several systems are described which fit the generic DSS idea, but which are (for the most part) not the customary kinds of systems encountered in business applications. Nevertheless, the concepts and techniques employed in these systems can make important contributions to the emergence of more powerful business oriented decision support systems. GRA

DATA QUALITY INDICATORS AND THEIR USE IN DATA BASE SYSTEMS
Robert L. Patrick May 1980 12 p
(RAND/P-6491) Avail: NTIS HC A02/MF A01

Data quality indicator (DQI) removes one flaw in the computer based information systems that lies with their inability to explicitly deal with uncertainty. The DQI is held in a one byte field immediately adjacent to the value whose quality it describes. When the value is read or written or moved, the accompanying quality indicator is also moved so the pair of fields are never separated. When the value is processed, the processing program can optionally process the quality indicator or ignore it. Simple examples are included to describe the concept adequately. The use of quality indicators to date and how this concept can lead to the solution of a major data processing problem that lies in the foreseeable future, are discussed. R.K.G.

FUNDAMENTAL ALGORITHMS FOR CONCURRENCY CONTROL IN DISTRIBUTED DATA BASE SYSTEMS Final Technical Report, Jul. 1979 - Jan. 1980
Philip A. Bernstein and Nathan Goodman Griffiss AFB, N.Y. RADC May 1980 267 p refs
(Contract F30602-79-C-0191; AF Proj. 5581; AF Proj. 2530)
(AD-A087996; RADC-TR-80-158) Avail: NTIS
HC A12/MF A01 CSCL 09/2

The state-of-the-art in distributed database concurrency control is consolidated. The heart of the analysis is a decomposition of the concurrency control problem into two major sub problems: read-write and write-write synchronization. A series of synchronization techniques for solving each sub-problem are described and it is shown how to combine synchronization techniques into algorithms that solve the entire concurrency control problem. Algorithms constructed in this way are called concurrency methods. Forty-eight principal concurrency control methods are

described. These methods include all practical algorithms for distributed database concurrency control that have appeared in the literature plus several new algorithms. In addition, an analysis of principal concurrency control methods in qualitative terms is performed. The analysis considers four cost factors: communication overhead, local processing overhead, transaction restarts, and transaction blocking. Results indicate that only about 10 of the principal concurrency control methods are reasonable choices in practice. Author

This project has investigated the costs imposed by the need for communication between user and machine and between components of the machine in solving data-processing problems. There have been three principal substasks. The first, exploration of the minimal costs of storing and accessing information in simple data structures, is the oldest and results have been reported in several publications. The second is the design of minimax optimal universal codeword sets which can be used to represent any message set efficiently by assigning messages in order of decreasing probability to codewords in order of increasing length. A manuscript giving results of this research is almost ready for publication. The third is the exploration of switching networks which can be used for communication between a number of processors engaged in common computational task: that work is still in an early stage and is not yet ready for publication. (Contract NSF ISP-78-02517)
(PB80-189491; NSF/RA-790346) Avail: NTIS
HC A11/MF A01 CSCL 05A

The Colorado General Assembly's needs for scientific and technological (S/T) resources was evaluated. Potentially useful ways to improve the Legislature's capacities to use S/T resources in its policy formulation, decisionmaking, and legislative processes are identified. A needs assessment survey found that between 14 and 27 percent of the bills introduced in a recent legislative session might require S/T expertise, knowledge, or research. Efforts to ascertain how needs for S/T inputs were made by Committee members and Legislative Research Council members ex post facto were unsuccessful. However, useful information was obtained on how inputs from S/T were perceived as technical or vested-interest inputs. GRA

HC A04/MF A01 CSCL 05A

Ways in which state and local governments can increase their capabilities for using science, engineering, and technology to meet the needs of their citizens are identified and analyzed. The results recommend the establishment of a five-part mechanism to assist the executive branch of the State government in the systematic, comprehensive, and ongoing use of Ohio's science, engineering, and technology resources in the State's policy making process. The mechanism comprises a resource coordinator, an agency resource advisory group, a council to provide direction, an annual science and government assembly, and the Ohio Academy of Science which assists agencies in establishing advisory groups. It is also recommended that science and technology resources be used most appropriately at the subcouncil level. GRA

THE SCIENCE, ENGINEERING, AND TECHNOLOGY PROGRAM FOR THE NEW JERSEY EXECUTIVE BRANCH
Aug. 1979 48 p
(Grant NSF ISP-78-13001)
(PB80-190242; NSF/RA-790419) Avail: NTIS
HC A03/MF A01 CSCL 05A

Based on interviews and several case study analyses, the overall scheme for incorporating science, engineering, and technology (SET) resources into New Jersey policies is identified and qualitatively evaluated. Also, comparative research into formal mechanisms linking science, technology, and policy in other states is conducted, and recommendations are obtained from ten other states. The results reveal the absence of a central source to advise and inform the executive branch on SET issues. Few top administrators perceive a problem with access to or incorporation of SET information into policy and decision making. Recommendations include expansion of the Governor's office to include staff with SET capabilities and an increase in the number of top level administrators in state government who have a working knowledge of SET components. CREATING A SCIENCE AND TECHNOLOGY INFORMATION CAPACITY FOR THE EXECUTIVE AND LEGISLATIVE BRANCHES OF THE DELAWARE STATE GOVERNMENT Final Report
1 Oct. 1979 88 p refs
(Grant NSF ISP-78-02508)
(PB80-190762; NSF/RA-790421) Avail: NTIS
HC A05/MF A01 CSCL 05A

Development of a mechanism for applying science and technology (S & T) to decision making within the executive and legislative branches of the State of Delaware was studied. The investigation involved assessing S & T needs of Delaware's General Assembly and Executive Branch, identifying S & T information resources within the State, reviewing S & T utilization experiences in other states, and developing an S & T information mechanism for Delaware. The mechanism that was developed uses professional societies within the State as an S & T resource. Successful models used by other states in developing an S & T program are included. GRA

SYMPOSIUM ON INTERNATIONAL STANDARDS INFORMATION AND ISONET Final Report
Charles B. Phucas Jun. 1980 65 p Symp. held at Gaithersburg, Md., 11-12 Oct. 1979 Sponsored in part by ANSI, New York
(PB80-197221; NBS-SP-579; LC-80-600073) Avail: NTIS
HC A04/MF A01 CSCL 05B

The American National Standards Institute (ANSI) and National Bureau of Standards working cooperatively with the International Organization for Standardization (ISO), provide United States input to the development of an International Standards Information Network called ISONET. Existing international standards information systems as well as the plans for the further development of ISONET are discussed. Developments in U.S. trade policy, especially those policies pertaining to standards and certification systems, are included. GRA

USE OF SCIENTIFIC AND TECHNICAL INFORMATION AND ADVICE BY THE CALIFORNIA LEGISLATURE: A SURVEY OF CURRENT POLICIES AND PROPOSALS FOR IMPROVEMENTS
Lawrence Marcus Baird Aug. 1979 131 p refs
(Grant NSF ISP-77-25862)
(PB80-189095; NSF/RA-790417) Avail: NTIS
HC A07/MF A01 CSCL 05B

The information network used by the legislative staff to obtain scientific and technical knowledge and advice in their role as advisors to California legislators is described. The utility of proposed mechanisms to improve the scientific and technical capacity of the staff was assessed. A case study approach was used to analyze the past successes and failures of the Assembly Science and Technology Advisory Council. The results of a recent study based on interviews with California legislative leaders and the senior staff regarding perceptions of science and technology are compared with findings from the questionnaire used in this study. APPLYING SCIENTIFIC AND TECHNOLOGICAL RESOURCES FOR NORTH DAKOTA POLICY DEVELOPMENT: STATE SCIENCE, ENGINEERING AND TECHNOLOGY PROGRAM Final Report
Clifford A. Ness, Jr. Sep. 1979 25 p refs
(Grant NSF ISP-78-04618)
(PB80-189624; NSF/RA-790418) Avail: NTIS
HC A02/MF A01 CSCL 05B

The establishement of a scince and technology (S & T) resource system designed to improve access of North Dakota Statepolicymakers to S & T resources is described. The S & T system emerged from a realization that the current method of gathering S & T information by an informal ad hoc method should be replaced by a more formal structure to meet specific and expanding needs. S & T resource systems and practices in other states as well as in North Dakota were reviewed. GRA

FY 1981 BUDGET PRESS BRIEFING
26 Jan. 1980 25 p
(NASA-TM-82195; P80-10157) Avail: NASA Scientific and Technical Information Facility, P.O. Box 8757, BWI Airport, Md. 21240 CSCL 05C

The proposed FY-81 budget for the National Aeronautics and Space Administration is briefly described. The total NASA budget is approximately $5.7 billion for 1981, and the submittal includes a request for a FY-80 supplemental appropriation of $300 million for space shuttle development. Supported projects in astronomy, space exploration, space technology applications, and aeronautics are identified. M.G.

INVESTIGATION INTO THE USE OF HYDROGEN PEROXIDE FOR THE PURIFICATION OF CARBONIZATION WASTES
Jun. 1979 20 p
(BCRA-67; CRR-67) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

Various liquors and liquor effluents were allowed to react for different periods with peroxide and the extent of purification was determined by simple analytical procedures. Hydrogen peroxide was not an economical method for the purification of spent liquors but, in the presence of a suitable catalyst, small amounts of peroxide gave good results with biologically treated effluents. A deterioration in the quality of the biological effluent resulted in an increased peroxide demand. The final effluent was inferior in quality to that obtained when the biological system was functioning efficiently. In the case of a biological effluent from the treatment of a pyrolysis waste, peroxide proved to be the only satisfactory method of further treatment. DOE

INTERFERENCE FILTER PHOTOMETRY OF PERIODIC COMET ASHBROOK-JACKSON
R. L. Newburn, Jr., J. F. Bell, and T. B. McCord Aug. 1980 30 p refs Prepared in cooperation with Hawaii Univ. at Manoa
(Contracts NAS7-100; JPL-699908)
(NASA-CR-163581; JPL-9950-418) Avail: NTIS HC A03/MF A01 CSCL 03A

P/Ashbrook-Jackson has a period of 7.43 years and comes to perihelion at 2.284 AU. It is a low inclination object (12.5 deg) of moderate eccentricity (0.400). In 1963, it made the best possible apparition, coming to perihelion and opposition virtually simultaneously, but no one made physical observations of faint periodic comets in 1963. In 1978 Ashbrook-Jackson came to opposition on Sept. 28, just 40 days after perihelion. It will be just over 100 years before an equally favorable apparition recurs. P/Ashbrook-Jackson was recovered by Pereyra at Cordoba Observatory on April 28, 1977, more than a year and a quarter before perihelion and already showing a diffuse coma with central condensation. Its helio-centric distance was then 3.7 AU. An extensive program was planned, but equipment problems and weather ultimately limited it to the two nights of data reported here. R.K.G.

LARGE DEPLOYABLE REFLECTOR (LDR) Final Report
W. H. Aiff Jul. 1980 124 p refs
(Contract NAS2-10427)
(NASA-CR-152402; LMSC-D766449) Avail: NTIS HC A06/MF A01 CSCL 03A

The feasibility and costs were determined for a 1 m to 30 m diameter ambient temperature, infrared to submillimeter oribiting astronomical telescope which is to be shuttle-deployed, free-flying, and have a 10 year orbital life. Baseline concepts, constraints on delivery and deployment, and the sunshield required are examined. Reflector concepts, the optical configuration, alignment and pointing, and materials are also discussed. Technology studies show that a 10 m to 30 m diameter system which is background and diffraction limited at 30 micron m is feasible within the stated time frame. A 10 m system is feasible with current mirror technology, while a 30 m system requires technology still in development. A.R.H.

TOTAL GAMMA ABSORPTION TELESCOPE WITH MULTI-PARAMETRIC ANALYSIS [TELESCOPIO GAMA A ABSORCAO TOTAL E ANALISE MULTIPARAMETRICA]
Daniel Jean Roger Nordemann, Jose Marques DaCosta, and Inacio Malmonge Martin Jun. 1980 17 p refs In PORTUGUESE; ENGLISH summary Presented at the 32d Reuniao Anual da SBPC, 6-12 Jul. 1980 Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Tecnologico
(INPE-1904-RPE/172) Avail: NTIS HC A02/MF A01

The present tendency of gamma ray astronomy is to build high performance telescopes using large detectors Ge(Li) and HPGe with anticoincidence system. A similar and competitive type of telescope using the principle of total absorption can be constructed with a large number of smaller detectors. This telescope would allow a better definition of the astrophysical sources. Such an apparatus would require more telemetry channels and more memory yet its price is lower than those of present gamma ray telescope projects. Author

SURFACE OF VENUS FROM PIONEER
28 May 1980 58 p
(NASA-TM-82193; P80-10154) Avail: NASA Scientific and Technical Facility, P.O. Box 8757, BWI Airport, Md. 21240 CSCL 03B

Radar data of the Venusian surface from the Pioneer Venus 1 are informally discussed. From the altimetry standpoint, the data are good to within 200 meters; the images have approximately a 30 km resolution with the altitude points being spaced 75 km in longitude and 100 km in latitude. Geological interpretations are offered based on the Pioneer data in conjunction with ground based radar and altimetry data. A 'plains' area is identified representing 65% of the planet which lies within 2 km of the nominal mean elevation. Three highland areas are identified and discussed. Venus has only 30% lowland as compared to the Earth's 75%. The high mountains are as high as the highest mountains on Earth, and the high plateaus are higher than the

greatest plateaus on Earth. Signs of regional tectonic motion are also discussed. M.G.

N80-33325*# National Aeronautics and Space Administration, Goddard Space Flight Center, Greenbelt, Md.
SURVEY OF THE PLASMA ELECTRON ENVIRONMENT OF JUPITER: A VIEW FROM VOYAGER
Jack D. Scudder, Edward C. Sittler, Jr., and H. S. Bridge (MIT, Cambridge) Aug. 1980 91 p refs Submitted for publication
(NASA-TM-80731) Avail: NTIS HC A05/MF A01 CSCL 03B

The plasma environment within Jupiter's bow shock is considered in terms of the in situ, calibrated electron plasma measurements made between 10 eV and 5.95 keV by the Voyager plasma science experiment (PLS). Measurements were analyzed and corrected for spacecraft potential variations; the data were reduced to nearly model independent macroscopic parameters of the local electron density and temperature. It is tentatively concluded that the radial temperature profile within the plasma sheet is caused by the intermixing of two different electron populations that probably have different temporal histories and spatial paths to their local observation. The cool plasma source of the plasma sheet and spikes is probably the Io plasma torus and arrives in the plasma sheet as a result of flux tube interchange motions or other generalized transport which can be accomplished without diverting the plasma from the centrifugal equator. The hot suprathermal populations in the plasma sheet have most recently come from the sparse, hot mid-latitude 'bath' of electrons which were directly observed juxtaposed to the plasma sheet. A.R.H.

N80-33326*# RAND Corp., Santa Monica, Calif.
COORDINATES OF FEATURES ON THE GALILEAN SATELLITES
Merton E. Davies and Frank Y. Katayama Jun. 1980 39 p refs
(Contracts NASw-3210; JPL-953613)
(NASA-CR-163582; RAND/P-6479) Avail: NTIS HC A03/MF A01 CSCL 03B

The coordinate systems of each of the Galilean satellites are defined and coordinates of features seen in the Voyager pictures of these satellites are presented. The control nets of the satellites were computed by means of single block analytical triangulations. The normal equations were solved by the conjugate iterative method which is convenient and which converges rapidly as the initial estimates of the parameters are very good. A.R.H.

92 SOLAR PHYSICS

Includes solar activity, solar flares, solar radiation and sunspots.

SCALE SIZE OF THE COSMIC RAY MODULATING REGION
R. P. Kane Jul. 1980 15 p refs Sponsored in part by Fundo Nacional de Desenvolvimento Cientifico e Technologico
(INPE-1826-RPE/192) Avail: NTIS HC A02/MF A01

The effects of using monthly means in the analysis of long term changes of cosmic ray intensity are examined. It is shown that these can have considerable pollution from Forbush decrease effects. In particular, a use of maximum daily mean in a month, instead of the monthly mean, seems to reduce the width of the hysteresis loops, thereby implying reduced dimensions of the modulating region for galactic cosmic ray intensity. M.G.

N80-33332*# National Aeronautics and Space Administration, Goddard Space Flight Center, Greenbelt, Md.
SPECTROSCOPY OF COMPACT EXTRAGALACTIC X-RAY SOURCES
Stephen S. Holt Sep. 1980 16 p refs Presented at the HEAD Meeting, AAS, Cambridge, Mass., Jan. 1980
(NASA-TM-82010) Avail: NTIS HC A02/MF A01 CSCL 03B

The X-ray spectra of compact extragalactic sources obtained from the HEAO-1 A-2 experiment and the solid-state spectrometer

onboard HEAO-2 (the Einstein Observatory) are reviewed. Seyfert spectra are remarkably consistent with characteristic power-law spectra of energy index alpha - 0.7 + .1 over a dynamic range of almost 100 in both luminosity for the whole sample, and energy for individual members. Radio-quiet quasars have similar spectra, perhaps slightly steeper, for the limited sample available. New solid-state spectrometer results for NGC 4151 yield a consistent picture for the geometry of the broad-line clouds in both these related radio-quiet classes of galactic nuclei. Radio-loud objects, especially BL Lacs, are considerably more variable in spectrum as well as luminosity. Direct synchrotron and synchrotron-self-Compton components are consistent with what we observe from these objects. Finally, the role of spectroscopy in addressing the extent to which compact extragalactic nuclei might contribute to the diffuse X-ray background is discussed. Author

ANOMALOUS ISOTOPIC COMPOSITION OF COSMIC RAYS
S. E. Woosley (California Univ., Santa Cruz) and Thomas A. Weaver 20 Jun. 1980 21 p refs Presented at the Astrophys. Workshop, Santa Cruz, Calif., 7-18 Jul. 1980
(Contract W-7405-eng-48)
(UCRL-84561; CONF-800728-1) Avail: NTIS HC A02/MF A01

Measurements of nonsolar isotopic patterns for the elements neon and (perhaps) magnesium in cosmic rays are interpreted within current models of stellar nucleosynthesis. One possible explanation is that the stars currently responsible for cosmic ray synthesis in the Galaxy are typically super-metal-rich by a factor of two or three. Other possibilities include the selective acceleration of certain zones or masses of supernovas or the enhancement of (22)Ne in the stellar medium by mass loss from red giant stars and planetary nebulas. Measurements of critical isotopic ratios are suggested to aid in distinguishing among the various possibilities. Some of these explanations place significant constraints on the fraction of cosmic ray nuclei that must be fresh supernova debris and the masses of the supernovas involved. DOE

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

A

ABLATION
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32331
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470
Beam nonuniformity effects on laser ablatively accelerated targets
[AD-A088056] N80-32711

ABLATIVE MATERIALS
Determination of kinetic parameters for thermal decomposition of phenolic ablative materials by multiple heating rate method
[AD-A087929] N80-32443

ABSORBERS (MATERIALS)
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953

ABSORPTION SPECTRA
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Total gamma absorption telescope with multiparametric analysis
[INPE-1804-RPE/172] N80-33321

ABSORPTION SPECTROSCOPY
Optical aerosol spectrometers factors affecting optical extinction predictions
[AD-A087658] N80-33035

AC GENERATORS
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856

ACCELERATED LIFE TESTS
Accelerated life testing effects on CMOS microcircuit characteristics
[NASA-CR-161575] N80-32653
Accelerated life tests and information
[AD-A088014] N80-32741

ACCELERATION (PHYSICS)
Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360
Acceleration sensitivity compensation of crystal resonators
[AD-A085883] N80-32662

ACCELERATION STRESSES (PHYSIOLOGY)
A technique for the injection of radioactive tracer microspheres during acceleration stress
[AD-A087931] N80-33087

ACCESS CONTROL
Fundamental algorithms for concurrency control in distributed data base systems
[AD-A087996] N80-33294

ACCIDENTS
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099

ACCURACY
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814

ACETATES
Diethylcarbamoyl chloride - Measurements Research Branch, analytical method
[PB80-193378] N80-32480
Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32601

ACETYLENE
Microwave properties of low density (CH) sub x
[AD-A086943] N80-32518

ACID RAIN
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-32980

ACOUSTIC EMISSION
Holographic and acoustic emission of evaluation of pressure vessels
[UCRL-84046] N80-32746

ACOUSTIC FATIGUE
Response of nonlinear panels to random loads N80-32766

ACOUSTIC IMPEDANCE
Unsteady transonic flows in a two-dimensional diffuser
[AD-A088231] N80-32400

ACOUSTIC MEASUREMENTS
Experimental studies of impulsive noise produced by spheres moving through water
[AD-A084419] N80-33179

ACOUSTIC MICROSCOPES
Acoustic microscopy at cryogenic temperatures
[AD-A087677] N80-32589

ACOUSTIC PROPAGATION
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177

ACOUSTIC RETROFITTING
Multiple pure tone elimination strut assembly
[NASA-CASE-FRC-11062-1] N80-32393

ACOUSTIC SCATTERING
Scattering matrix analysis of surface acoustic wave reflections and transducers
[AD-A085764] N80-33180

ACOUSTIC SOUNDING
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075

ACOUSTICAL HOLOGRAPHY
Liquid surface levitation holography. Part 1: Theoretical
[AD-A088418] N80-32703
Acoustic holography. Citations from the NTIS data base
[PB80-812530] N80-32707
Acoustic holography. Citations from the Engineering Index data base
[PB80-812548] N80-32708

ACOUSTICS
Signal processing aspects of nonlinear acoustics
[AD-A088369] N80-33181

ACOUSTO-OPTICS
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Present and future trends in signal processing technologies
[AD-A088085] N80-32634
Basic research in electronics, JSEP
[AD-A088121] N80-32672
Acoustic holography. Citations from the NTIS data base
[PB80-812530] N80-32707
Acoustic holography. Citations from the Engineering Index data base
[PB80-812548] N80-32708

ACRYLIC RESINS
Oxidative stabilization of acrylic fibers. Part 5: The decoloration reaction
[AD-A088299] N80-32523

ACTIVATED SLUDGE
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

ACTIVATION (BIOLOGY)
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

ACTIVATION ENERGY
Thermally stimulated discharge current analysis of epoxy resins
[AD-A088213] N80-32526
Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541

ACTIVE CONTROL
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353

ACTUATORS
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724

ADAPTIVE FILTERS
Building block for an orthonormal-lattice-filter adaptive network
[AD-A088088] N80-32671

ADDITIVES
Service test of two fuel conductivity additives
[AD-A088046] N80-32540

ADHESION TESTS
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385

SUBJECT

ADIABATIC CONDITIONS
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778
ADSORPTION
Vibrational frequencies of halogen atoms adsorbed on silver metal surfaces
[AD-A087664] N80-32491
ADSORPTIVITY
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444
AERATION
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848
Performance evaluation of the aerated lagoon system at North Guifort, Mississippi
[PB80-187461] N80-32985
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189881] N80-33015
AERIAL PHOTOGRAPHY
Investigation of photographic image quality estimators
[AD-A087805] N80-32702
AERIAL RECONNAISSANCE
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047
AEROACOUSTICS
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176
AERODYNAMIC CHARACTERISTICS
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90 — conducted in Langley 6 by 28 inch transonic tunnel
[NASA-TP-1701] N80-32333
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347
Handling qualities of large flexible aircraft
[NASA-CR-163593] N80-32402
AERODYNAMIC CONFIGURATIONS
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft — Ames 40- by 80-ft wind tunnel
[NASA-CR-152349] N80-32337
Study of an advanced transport airplane design concept known as Flatbed
[NASA-CR-159337] N80-32377
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309
AERODYNAMIC DRAG
Afterbody drag. Volume 1: Drag of conical and circular ARC afterbodies without jet flow
[AD-A087514] N80-32341
Afterbody drag. Volume 2: Jet interference effects on subsonic boattail drag
[AD-A087515] N80-32342
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351
AERODYNAMIC HEAT TRANSFER
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32331
AERODYNAMIC HEATING
Some aerodynamic considerations related to wind tunnel model surface definition
[NASA-TM-81820] N80-32376
AERODYNAMIC LOADS
User's manual for the vertical axis wind turbine performance computer code darter
[SAND-80-1155] N80-32572
AERODYNAMIC NOISE
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176
AERODYNAMIC STABILITY
Helicopter dynamic performance program. Volume 1: Engineer's manual
[AD-A088474] N80-32396
AEROELASTICITY
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329
AERONAUTICS
General aviation activity and avionics survey, 1978
[AD-A087663] N80-32325
AEROSOLS
Beta gauge instrumentation for the measurement of aerosol mass
[PB80-195175] N80-32706
Environmental Measurements Laboratory
[EML-374] N80-32978
Proceedings: Advances in Particle Sampling and Measurement
[PB80-187487] N80-33014
Optical aerosol spectrometers factors affecting optical extinction predictions
[AD-A087656] N80-33035
Passive 19.3 GHz radiometer and aerosol data from the North Sea during MARSEN I, September - October 1979
[AD-A088229] N80-33058
AEROSPACE MEDICINE
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085
AFRICA
A plan for a system to provide developmental information in Africa
[PB80-189806] N80-33315
AFTERBODIES
Afterbody drag. Volume 1: Drag of conical and circular ARC afterbodies without jet flow
[AD-A087514] N80-32341
Boundary-layer flow on an axisymmetric body with an inflected stern
[AD-A088526] N80-32595
AGING (METALLURGY)
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488
AGRICULTURE
Production of sugarcane and tropical grasses as a renewable energy source
[DOE-ET-20071/T1] N80-32546
Synthetic fuels from municipal, industrial and agricultural wastes. Citations from the American Petroleum Institute data base
[PB80-812365] N80-32579
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling — Corn Belt
[E80-10327] N80-32818
Applied Remote Sensing Program (ARSP) — Arizona
[E80-10330] N80-32821
Infrared-temperature variability in a large agricultural field — Dunnigan, California
[E80-10331] N80-32822
The application of remote sensing to resource management and environmental quality programs in

[E80-10337] N80-32825
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 2: Technical results
[SAND-79-7018/2-VOL-2] N80-32870
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
AGRISTARS PROJECT
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32808
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling — Corn Belt
[E80-10327] N80-32818
AGROCLIMATOLOGY
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling — Corn Belt
[E80-10327] N80-32818
AGROMETEOROLOGY
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
AIR CARGO
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A086057] N80-32384
AIR CONDITIONING
Apparatus for supplying conditioned air at a substantially constant temperature and humidity
[NASA-CASE-GSC-12191-1] N80-32583
Effects of energy-efficient ventilation rates on indoor air quality at an Ohio elementary school
[LBL-10223] N80-32595
Occupant-generated CO2 as an indicator of ventilation rate
[LBL-10498] N80-32984
AIR DEFENSE
Millimeter wave radar system concept study, phase 1
[AD-A087767] N80-32620
AIR FLOW
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177
AIR POLLUTION
The effect of designated pollutants on plant species
[AD-A078693] N80-32969
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976
Constraints on carbon dioxide production from fossil fuel use
[ORAU/IEA-80-9(M)] N80-32983
Incentives for technological innovation in air pollution reduction: An ETIP (Experimental Technology Incentives Program) policy research series. Volume 2. Market mechanisms for emission regulation and enforcement of emission limits: Deterrence and demand
[PB80-186083] N80-32991
Economic impact of sulfur dioxide and particulate matter regulations in Illinois
[PB80-182645] N80-32992
Performance of simple models for stack plume dispersion during convective conditions
[PB80-191969] N80-33001
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187453] N80-33013
Proceedings: Advances in Particle Sampling and Measurement
[PB80-187487] N80-33014
Regulated and unregulated exhaust emissions from malfunctioning non-catalyst and oxidation catalyst gasoline automobiles
[PB80-190473] N80-33017
Regulated and unregulated exhaust emissions from malfunctioning three-way catalyst gasoline automobiles
[PB80-190804] N80-33020
Incentives for technological innovation in air pollution reduction: An ETIP policy research series. Volume 1: Emission offset policy at work. A summary analysis of 8 cases
[PB80-187610] N80-33022
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071

AIR QUALITY
High solids coating system
[AD-A088225] N80-32525
Effects of energy-efficient ventilation rates on indoor air quality at an Ohio elementary school
[LBL-10223] N80-32595
Applied Remote Sensing Program (ARSP) — Arizona
[E80-10330] N80-32821
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963
Occupant-generated CO2 as an indicator of ventilation rate
[LBL-10496] N80-32984
Methodologies to conduct regulatory impact analysis of ambient air quality standards for carbon monoxide
[PB80-192461] N80-33005
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009

AIR SAMPLING
Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187388] N80-32577

AIR TRAFFIC CONTROL
NASA aviation safety reporting system
[NASA-TM-81197] N80-32352
FAA's collision-avoidance program
[GPO-40-611] N80-32365
Discrete Address Beacon System (DABS) front end processor en route central computer complex protocol
[AD-A085482] N80-32367

AIR TRAFFIC CONTROLLERS (PERSONNEL)
The effect of the Western Union Weather Data System on the preflight briefing position at the Chicago Flight Service Station
[AD-A088415] N80-33065

AIR WATER INTERACTIONS
Passive 19.3 GHz radiometer and aerosol data from the North Sea during MARSEN I, September - October 1979
[AD-A088229] N80-33068
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075
On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088062] N80-33076

AIRBORNE RADAR APPROACH
Airborne radar approach flight test evaluating various track orientation techniques
[AD-A088426] N80-32368

AIRCRAFT
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099

AIRCRAFT ACCIDENT INVESTIGATION
Evaluation of safety programs with respect to the causes of general aviation accidents: Volume 1: Technical report
[AD-A087685] N80-32355

AIRCRAFT ACCIDENTS
Aircraft crash survival design guide. Volume 4: Aircraft seats, restraints, litters, and padding
[AD-A088441] N80-32358

AIRCRAFT APPROACH SPACING
NASA aviation safety reporting system
[NASA-TM-81197] N80-32352

AIRCRAFT DESIGN
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
Study of an advanced transport airplane design concept known as Flatbed
[NASA-CR-159337] N80-32377
Air cushion craft development, first revision
[AD-A084740] N80-32592

AIRCRAFT DETECTION
Millimeter wave radar system concept study, phase 1
[AD-A087767] N80-32620
Terrain scatter parameter model — detection of low flying aircraft
[AD-A084248] N80-32626

AIRCRAFT ENGINES
Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N80-32392
Nickel cadmium batteries. Citations from the NTIS data base
[PB80-812340] N80-32966
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309

AIRCRAFT EQUIPMENT
OH-58C helicopter mast mounted sight/designator safety statement
[AD-A087673] N80-32390

AIRCRAFT FUEL SYSTEMS
General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354
Integral aircraft fuel tank leak classification
[AD-A088168] N80-32388

AIRCRAFT GUIDANCE
Flight performance of the TCV B-737 airplane at Montreal/Dorval International Airport, Montreal, Canada, using TRSB/MLS guidance
[NASA-TM-81885] N80-32361

AIRCRAFT HYDRAULIC SYSTEMS
Advanced fluid system simulation
[AD-A088060] N80-32522

AIRCRAFT LANDING
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338

AIRCRAFT MAINTENANCE
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326

AIRCRAFT MANEUVERS
Conceptual study of modifying an existing fighter for V/STOL capability and combat maneuvering enhancement
[AD-A087657] N80-32380

AIRCRAFT NOISE
Investigation of performance, noise, and detectability characteristics of Remotely Piloted Vehicle (RPV) propellers
[AD-A088325] N80-32398
Airframe noise reduction studies and clean-airframe noise investigation
[NASA-CR-159311] N80-33175
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184

AIRCRAFT PERFORMANCE
Handling qualities of large flexible aircraft
[NASA-CR-163593] N80-32402
Air cushion craft development, first revision
[AD-A084740] N80-32592

AIRCRAFT PILOTS
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

AIRCRAFT SAFETY
General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354
Evaluation of safety programs with respect to the causes of general aviation accidents: Volume 1: Technical report
[AD-A087685] N80-32355
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

AIRCRAFT STRUCTURES
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329
Advanced structures concepts r and m/cost assessments — helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374
A review and analysis of fiber counting methods
[AD-A088240] N80-32448
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309

AIRCRAFT SURVIVABILITY
Aircraft crash survival design guide. Volume 4: Aircraft seats, restraints, litters, and padding
[AD-A088441] N80-32358

AIRFOILS
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90 — conducted in Langley 6 by 28 inch transonic tunnel
[NASA-TP-1701] N80-32333
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176

AIRFRAMES
Advanced structures maintenance concepts
[AD-A087609] N80-32324
Response of nonlinear panels to random loads
N80-32766
Airframe noise reduction studies and clean-airframe noise investigation
[NASA-CR-159311] N80-33175

AIRGLOW
Wave disturbances in the low latitude ionosphere and equatorial ionosphere plasma depletions
[INPE-1806-RPE/174] N80-33027
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032

AIRPORT PLANNING
A new theory for rapid calculation of the ground pattern of the incident sound intensity produced by a maneuvering jet airplane
[NASA-TP-1733] N80-32334

AIRPORT TOWERS
The effect of the Western Union Weather Data System on the preflight briefing position at the Chicago Flight Service Station
[AD-A088415] N80-33065

AIRPORTS
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182

AIRSHIPS
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351

ALCOHOLS
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
First report to Congress on the use of alcohol in motor fuels
[DOE/CS-0165] N80-32548
Automotive fuels from cellulose materials
[NZERDC-49] N80-32571
Alcohol fuels. Citations from the NTIS data base
[PB80-812431] N80-32580
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812449] N80-32581
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812456] N80-32582

ALFALFA
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling — Corn Belt
[E80-10327] N80-32818

ALGAE
Liquid fuels production from biomass — corn and algae
[COO-4388-10] N80-32545
Rock filters for removal of algae from lagoon effluents
[PB80-190077] N80-33016

ALGORITHMS
Advanced restraint system modeling
[AD-A088029] N80-32357
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460

Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594
Building block for an orthonormal-lattice-filter adaptive network
[AD-A088088] N80-32671
Numerical solution of a nonsteady blast wave propagation in two-phase (separated flow) reactive medium
[TAE-388] N80-32686
The mechanism of a detonation wave enhancement in a two-phase combustible medium
[TAE-393] N80-32687
On extracting brightness temperature maps from scanning radiometer data — techniques for algorithm design
[NASA-TM-81989] N80-32838
Efficient algorithms for solving systems of ordinary differential equations for ecosystem modeling
[PB80-190986] N80-33002
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093
Computer treatment of perspective for solids
[INPE-1785-RPE/157] N80-33105
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127
Rapid solution of finite element equations on locally refined grids by multi-level methods
[AD-A088065] N80-33139
Compiling fast partial derivatives of functions given by algorithms
[COO-2383-0063] N80-33145
Qualitative matrices: Strong sign-solvability and weak satisfiability
[AD-A087686] N80-33168
Fundamental algorithms for concurrency control in distributed data base systems
[AD-A087996] N80-33294

ALIGNMENT
Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360

ALIPHATIC COMPOUNDS
Liquid fuels production from biomass
[COO-4388-11] N80-32563

ALLOTROPY
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497

ALLOYS
Fundamentals of corrosion fatigue behavior of metals and alloys
[AD-A088358] N80-32496

ALPHA PARTICLES
Fusion product deposition and energy balance
[UCID-18710] N80-33204

ALPHANUMERIC CHARACTERS
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100

ALTERNATING CURRENT
AC losses in type-2 superconductors
[IS-M-280] N80-32679

ALTITUDE CONTROL
Guidance and control of tactical missiles
[AD-A085147] N80-32422

ALUMINUM
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940
Aluminum air battery for electric vehicle propulsion
[UCRL-84443] N80-32941
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223

ALUMINUM ALLOYS
Comparison of flow curves of 6061 aluminum alloy at high and low strain rates
[LA-UR-80-1649] N80-32502
Microstructure and tensile properties of heavily irradiated 5052-0 aluminum alloy
[CONF-800609-3] N80-32511
Glasses and glass ceramics for sealing to aluminum alloys
[SAND-79-1405C] N80-32528
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209

ALUMINUM ARSENIDES
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1762-RPE/151] N80-33253

ALUMINUM GALLIUM ARSENIDES
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928

ALUMINUM OXIDES
Vibrational spectra of carbon monoxide chemisorbed on alumina-supported nickel particles: A tunneling spectroscopy study
[AD-A088044] N80-32453

AMBIENT TEMPERATURE
Studies on the removal of carbon monoxide from the atmosphere at ambient temperture — submarine atmospheres
[AD-A085469] N80-33098

AMORPHOUS MATERIALS
Development of a low loss magnetic composite utilizing amorphous metal flake
[CONS-3205-T1] N80-32509
Electronic structure and stability of metallic glasses
[AD-A088292] N80-33257

AMPLIFIER DESIGN
Design, fabricate and test an Electron Bombarded Semiconductor (EBS) amplifier
[NASA-CR-160002] N80-32656

AMPLIFIERS
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859

ANALOG TO DIGITAL CONVERTERS
Josephson A/D converter development
[AD-A087671] N80-32657

ANALYSIS (MATHEMATICS)
Analysis of liquid volume and liquid mass fractions at coexistence for pure fluids
[PB80-191133] N80-32481

ANALYTICAL CHEMISTRY
Diethylcarbamoyl chloride - Measurements Research Branch, analytical method
[PB80-193378] N80-32480

ANECHOIC CHAMBERS
Experimental studies of impulsive noise produced by spheres moving through water
[AD-A084419] N80-33179

ANGLE OF ATTACK
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
Laser angle measurement system
[NASA-CR-159306] N80-32405

ANGULAR DISTRIBUTION
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32364

ANGULAR MOMENTUM
Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317

ANHYDRIDES
Prepolymer dianhydrides
[NASA-CASE-NPO-13899-1] N80-32515

ANISOTROPY
Thermodynamic properties of solid helium using an anharmonic anisotropic continuum model
[DOE/ER-01198/1314] N80-32598
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140

ANNEALING
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33282

ANNUAL VARIATIONS
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031

ANOMALOUS TEMPERATURE ZONES
Remote sensing applied to the prospecting of geothermal anomaly in Caldas Novas County, State of Goias, Brazil
[INPE-1792-RPE/164] N80-32837

ANTENNA ARRAYS
Low sidelobe S-band line source array
[AD-A087651] N80-32616
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632
Building block for an orthonormal-lattice-filter adaptive network
[AD-A088088] N80-32671
Basic research in electronics, JSEP
[AD-A088121] N80-32672

ANTENNA DESIGN
Multiple band circularly polarized microstrip antenna
[NASA-CASE-MSC-18334-1] N80-32604
Diffraction of a Cassegrain antenna subreflector
[INPE-1827-RPE/193] N80-32613
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies — rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861

ANTENNA RADIATION PATTERNS
Computations of the radiation pattern of a reflector antenna
[AD-A088273] N80-32633
Radiation intensity of the PAVE PAWS radar system
[AD-A088323] N80-32646

ANTENNAS
A bounds on the resonant frequency of rectangular microstrip antennas
[NASA-TM-81882] N80-32609

ANTIMATTER
Heavy weak bosons, cosmic antimatter and DUMAND. 2: Looking for cosmic antimatter with DUMAND
[NASA-TM-82017] N80-33333

ANTIMISSILE DEFENSE
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645
Radiation intensity of the PAVE PAWS radar system
[AD-A088323] N80-32646

APPROACH CONTROL
Airborne radar approach flight test evaluating various track orientation techniques
[AD-A088426] N80-32368
PROCRU: A model for analyzing crew procedures in approach to landing
[NASA-CR-152397] N80-33090

APPROPRIATIONS
Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-166] N80-33310
NASA authorization for fiscal year 1979, part 1
[GPO-25-603] N80-33311

APPROXIMATION
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32624
Approximation schemes for the linear-quadratic optimal control problem associated with delay equations
[AD-A088245] N80-33121
Automatic multirate methods for ordinary differential equations
[COO-2383-0062] N80-33147
More on approximations of Poisson probabilities
[BNL-27878] N80-33164
FY 1981 budget press briefing
[NASA-TM-82195] N80-33308

AQUEOUS SOLUTIONS
Method of cross-linking polyvinyl alcohol and other water soluble resins
[NASA-CASE-LEW-13103-1] N80-32516

AQUIFERS
Seasonal thermal energy storage
[PNL-3322] N80-32899

ARC WELDING
Mini arc welding/brazing technique
[PB80-186497] N80-32739

ARCHIPELAGOES
A quantitative analysis of inter-island telephony traffic in the Pacific Basin Region (PBR)
[NASA-TM-81587] N80-32610
ARCHITECTURE (COMPUTERS)
Advanced SMITE reference manual
[AD-A087743] N80-33106
Fault tolerant computer network study
[AD-A088066] N80-33118
ARGON
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
ARID LANDS
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
ARITHMETIC
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087564] N80-33111
ARIZONA
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
ARMED FORCES (UNITED STATES)
The US Air Service in World War I. Volume 3: The Battle of Saint Mihiel
[AD-A088294] N80-32327
ARMOR
Materials response to ultra-high loading rates --- with application to armor The state of understanding of the response of metals to ultrahigh loading rates is reviewed, with application to armor.
[NMAB-356] N80-32485
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778
ARRAYS
Simple economic evaluation and applications experiments for photovoltaic systems for remote sites
[SAND-80-0749C] N80-32937
Circular scan streak tube development
[NASA-CR-160029] N80-33211
ARROW WINGS
Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332
ARTIFICIAL INTELLIGENCE
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724
Knowledge acquisition, knowledge programming, and knowledge refinement
[RAND/R-2540-NSF] N80-33120
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293
ARTIFICIAL SATELLITES
A demonstration of satellite shielding
[AD-A087752] N80-32421
ASHES
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006
ASPHALT
Permanent deformation of flexible pavements
[AD-A087859] N80-32588
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600
ASSESSMENTS
Environmental assessment. Energy efficiency standards for consumer products
[DOE/CS-0168] N80-32988
Colorado General Assembly science and technology resource needs assessment study
[PB80-189491] N80-33299
ASTRONOMICAL CATALOGS
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32364
ASTRONOMICAL MODELS
Supernova models and light curves
[UCRL-84578] N80-33323
ASTRONOMICAL TELESCOPES
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319
ASYMPTOTES
Asymptotically distribution-free simultaneous confidence region of treatment differences in a randomized complete block design
[AD-A088115] N80-33136
ASYMPTOTIC SERIES
A continued fraction representation for Theodorsen's circulation function
[NASA-TM-81838] N80-32330
Asymptotic conservativeness and efficiency of Kruskal-Wallis test for K dependent samples
[AD-A088249] N80-33157
ATLAS LAUNCH VEHICLES
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
ATMOSPHERIC ATTENUATION
CTS attenuation and cross polarization measurements at 11.7 GHz
[NASA-CR-160025] N80-32612
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617
The microwave applications theory program at NRL and some chemistry code applications to ionospheric heating by microwave radiation
[AD-A088275] N80-33039
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047
ATMOSPHERIC CIRCULATION
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048
Stepwise linear regression experiments in 14- and 19-day hemispheric weather prediction
[INPE-1757-RPE/146] N80-33049
A climatological study of the tropospheric circulation over the Amazon region
[INPE-1761-RPE/150] N80-33050
ATMOSPHERIC DENSITY
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
ATMOSPHERIC DIFFUSION
Use of helium-3 as a gas tracer for meso-scale meteorological studies
[DP-MS-79-51] N80-33070
ATMOSPHERIC ENTRY SIMULATION
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
ATMOSPHERIC MODELS
Study program for encapsulation materials interface for low cost silicon solar array
[NASA-CR-163583] N80-32857
Atmospheric transmittance/radiance: Computer code LOWTRAN 5
[AD-A088215] N80-33042
ATMOSPHERIC MOISTURE
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444
ATMOSPHERIC PHYSICS
Atmospheric transmittance/radiance: Computer code LOWTRAN 5
[AD-A088215] N80-33042
ATMOSPHERIC PRESSURE
Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
ATMOSPHERIC RADIATION
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32430
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048
ATMOSPHERIC SOUNDING
High resolution infrared radiation sounder/mod 2 (HIRS/2)
[NASA-CR-160030] N80-33055
ATMOSPHERIC TEMPERATURE
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071
The Gulf Stream Meanders experiment: Current meter, atmospheric, and sea level data report for the mooring period
[AD-A088069] N80-33077
ATMOSPHERIC TURBULENCE
Definition of gust model concept and review of gust models
[PNL-3138] N80-33072
ATOMIC COLLISIONS
Photoionization of atoms
[COO-2892-18] N80-33192
ATOMIC EXCITATIONS
Plasma diagnostics using photon-induced charge transfer
[AD-A088228] N80-33229
ATOMIC STRUCTURE
Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541
Electronic structure and stability of metallic glasses
[AD-A088292] N80-33287
ATOMS
Photoionization of atoms
[COO-2892-18] N80-33192
ATTACKING (ASSAULTING)
Multiple Threat Generator (MTG-100)
[AD-A087477] N80-32622
ATTENUATION
Beta gauge instrumentation for the measurement of aerosol mass
[PB80-195175] N80-32706
ATTENUATORS
Power ratings of rf thin film resistive attenuators
[BDX-613-2404] N80-32683
ATTITUDE (INCLINATION)
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628
ATTITUDE CONTROL
Potential problems relative to TDRS/IUS tilt table elevation with failed VRCS
[NASA-TM-82201] N80-32411
AUDITORY FATIGUE
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101
AUDITORY PERCEPTION
A constant percentage bandwidth transform for acoustic signal processing
[AD-A085666] N80-33178
AUGER SPECTROSCOPY
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953
Study of grain boundary segregation using the Auger electron emission technique
[DOE/ER-02166] N80-33280
AUSTENITE
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
AUSTENITIC STAINLESS STEELS
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209
AUTOCORRELATION
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149
AUTOMATA THEORY
Knowledge acquisition, knowledge programming, and knowledge refinement
[RAND/R-2540-NSF] N80-33120

AUTOMATIC CONTROL
Modeling and control of transonic cryogenic wind tunnels
[NASA-CR-163588] N80-32403
Automating the E-beam laser
[AD-A079529] N80-32709
On-line direct digital control extrusion process
[PB80-186489] N80-32738
AUTOMATIC CONTROL VALVES
The design of a fluidic oxygen intermittent demand flow device
[AD-A084083] N80-33097
AUTOMATIC LANDING CONTROL
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338
AUTOMATIC PICTURE TRANSMISSION
APT 80-1 technical notes
[INPE-1845-NTE/162] N80-32419
AUTOMATIC TEST EQUIPMENT
Automatic test equipment
[AD-A088177] N80-32408
Availability/operational readiness test subsystem cost tradeoffs
[AD-A088201] N80-32743
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755
AUTOMOBILE ENGINES
Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733
Catalyst effectiveness of high mileage in use vehicles
[PB80-192776] N80-33008
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012
Regulated and unregulated exhaust emissions from malfunctioning non-catalyst and oxidation catalyst gasoline automobiles
[PB80-190473] N80-33017
Regulated and unregulated exhaust emissions from malfunctioning three-way catalyst gasoline automobiles
[PB80-190604] N80-33020
AUTOMOBILE FUELS
Modifications for use of methanol or methanol-gasoline blends in automotive vehicles
[ALO-3682-T1] N80-32552
Automotive fuels from cellulose materials
[NZERDC-49] N80-32571
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
Potential of diesel engine, emission technology
[PB80-192685] N80-32735
Aluminum air battery for electric vehicle propulsion
[UCRL-84443] N80-32941
AUTOMOBILES
Pavement and geometric design criteria for minimizing hydroplaning. A technical summary
[PB80-190457] N80-32603
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
Potential of diesel engine, emission technology
[PB80-192685] N80-32735
Potential of spark ignition engine, effect of vehicle design variables on top speed, performance, and fuel economy
[PB80-191836] N80-32736
Potential of spark ignition engine, 1979 summary source document
[PB80-191034] N80-32737
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187453] N80-33013
AUXILIARY POWER SOURCES
Planning for electric utility solar applications: The effects on reliability and production cost estimates of the variability in demand
[SERI/TP-351-545] N80-32888
AVAILABILITY
Availability/operational readiness test subsystem cost tradeoffs
[AD-A088201] N80-32743
AVIONICS
Technological innovation in the design and development of the space transportation system
[NASA-TM-82190] N80-32423
Fault tolerant computer network study
[AD-A088066] N80-33118
AXIAL LOADS
Theoretical studies of columns under axial impact and experimental verification
[TAE-377] N80-32749
AXIAL STRAIN
Effects of axisymmetric contractions on turbulence of various scales
[NASA-CR-165136] N80-32328
AXIAL STRESS
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32802
AXISYMMETRIC BODIES
Boundary-layer flow on an axisymmetric body with an inflected stern
[AD-A088526] N80-32695
AXISYMMETRIC FLOW
Numerical solutions for steady thermal convection from a concentrated source in a porous medium
[SAND-79-2214] N80-32698
AZIMUTH
Multibeam single frequency synthetic aperture radar processor for imaging separate range swaths
[NASA-CASE-NPO-14525-2] N80-32607

B

BACILLUS
Repair and cell cycle response in cells exposed to environmental biohazards
[ORO-4568-26] N80-32912
BACKGROUND NOISE
Noise suppression methods for robust speech processing
[AD-A085667] N80-32629
BACKGROUND RADIATION
Reduction and assessment of infrared background data
[AD-A088241] N80-33218
BACKSCATTERING
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037
BACTERIA
Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003
BALANCING
Development of flexible rotor balancing criteria
[NASA-CR-159506] N80-32720
BALL BEARINGS
Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897
BALLISTICS
Initial study of ballistic effects for the operation of GaAs FET devices
[AD-A088350] N80-33270
BALLOON-BORNE INSTRUMENTS
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1863-RPE/213] N80-33322
BAND STRUCTURE OF SOLIDS
Self-consistent APW-k-vector, p vector method. 1: Theory
[INPE-1763-RPE/152] N80-33252
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1762-RPE/151] N80-33253
BANDPASS FILTERS
Filter development for the extreme ultraviolet explorer
[NASA-CR-160039] N80-32418
BANDWIDTH
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
A constant percentage bandwidth transform for acoustic signal processing
[AD-A085666] N80-33178
BARLEY
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
BASKETS
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585
BAYES THEOREM
Accelerated life tests and information
[AD-A088014] N80-32741
Nonparametric empirical Bayes estimation of reliability
[AD-A088182] N80-32742
Nonparametric Bayes estimation of distribution functions and the study of probability density estimates
[AD-A088250] N80-33156
Some Bayes estimators of reliability for the inverse Gaussian lifetime model
[AD-A088078] N80-33158
BEACHES
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
BEAM CURRENTS
Heavy ion beams for inertial fusion
[SLAC-PUB-2524] N80-33200
BEAMS (RADIATION)
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632
BEAMS (SUPPORTS)
Post-buckling behavior of a beam-column on a nonlinear elastic foundation with a gap N80-32767
Corotational velocity strain formulations for nonlinear analysis of beams and axisymmetric shells N80-32775
BEARINGLESS ROTORS
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957
BELGIUM
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
BENDING
Bending behavior of lapped plastic EHV cables
[BNL-27331] N80-32789
BENZENE
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483
BERNOULLI THEOREM
Estimators for the truncated beta-binomial distribution
[CONF-800644-1] N80-33148
BERYLLIUM
Consistent stress-strain ductile fracture model as applied to two grades of beryllium
[SAND-79-2126] N80-32793
BETA PARTICLES
Beta gauge instrumentation for the measurement of aerosol mass
[PB80-195175] N80-32706
BIAS
Electrical self-aligning connector
[NASA-CASE-MFS-25211-1] N80-32651
BIBLIOGRAPHIES
Technology for large space systems. A special bibliography with indexes, supplement 3
[NASA-SP-7046(03)] N80-32410
Metal matrix composites. A bibliography with abstracts
[PB80-811912] N80-32513
Synthetic fuels from municipal, industrial and agricultural wastes. Citations from the American Petroleum Institute data base
[PB80-812365] N80-32579
Alcohol fuels. Citations from the NTIS data base
[PB80-812431] N80-32580
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812449] N80-32581
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812456] N80-32582

Acoustic holography. Citations from the NTIS data base
[PB80-812530] N80-32707
Acoustic holography. Citations from the Engineering Index data base
[PB80-812548] N80-32708
Energy. A continuing bibliography with indexes, issue 26, 1 April - 30 June 1980
[NASA-SP-7043(26)] N80-32849
Forecasts of energy technology. Citations from the International Aerospace Abstracts data base
[NASA-CR-163596] N80-32965
Nickel cadmium batteries. Citations from the NTIS data base
[PB80-812340] N80-32966
Lithium batteries. Citations from the NTIS data base
[PB80-812399] N80-32967
Lithium batteries. Citations from the Engineering Index data base
[PB80-812407] N80-32968
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021

BINARY STARS
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

BIOCHEMISTRY
Biotechnology for a renewable resources chemicals and fuels industry, biochemical engineering R and D
[SERI/TP-621-659] N80-32561

BIOCONVERSION
Micro-level land use impacts of bioconversion
[LA-UR-80-1426] N80-32562

BIODYNAMICS
Advanced restraint system modeling
[AD-A088029] N80-32357

BIOGEOCHEMISTRY
Modeling the role of terrestrial ecosystems in the global carbon cycle
[CONF-800549-3] N80-32981

BIOLOGICAL EFFECTS
Preliminary study of the behavioral and biological effects of high intensity 60 Hz electric fields
[SWRI-14-5277] N80-33088

BIOMASS
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544

BIOMASS ENERGY PRODUCTION
Liquid fuels production from biomass --- corn and algae
[COO-4388-10] N80-32545
Production of sugarcane and tropical grasses as a renewable energy source
[DOE-ET-20071/T1] N80-32546
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547
Biotechnology for a renewable resources chemicals and fuels industry, biochemical engineering R and D
[SERI/TP-621-659] N80-32561
Micro-level land use impacts of bioconversion
[LA-UR-80-1426] N80-32562
Liquid fuels production from biomass
[COO-4388-11] N80-32563
California's biomass and its energy potential
[LBL-10058] N80-32564
Automotive fuels from cellulose materials
[NZERDC-49] N80-32571
Biomass energy production. Citations from the International Aerospace Abstracts data base
[PB80-810807] N80-32578

BIOT METHOD
Calculation of the Biot-Savart law magnetic field using current distributions obtained from a finite element analysis
[AD-A088094] N80-33172

BIREFRINGENCE
Electro-optical measurements of solid insulator surface fields and surface charging in vacuum
[PB80-192875] N80-32685

BIVARIATE ANALYSIS
Asymptotically distribution-free simultaneous confidence region of treatment differences in a randomized complete block design
[AD-A088115] N80-33136
A robust estimator of the difference between location parameters of correlated variables for fragmentary samples
[AD-A088109] N80-33162

BLACK BODY RADIATION
Heavy weak bosons, cosmic antimatter and DUMAND. 2: Looking for cosmic antimatter with DUMAND
[NASA-TM-82017] N80-33333

BLANKETS (FUSION REACTORS)
Fusion reactor blanket/shield design study
[ANL/FPP-79-1] N80-33242

BLOOD
Development of analytical techniques for toxicokinetic research
[AD-A077729] N80-33080

BLOOD CIRCULATION
A technique for the injection of radioactive tracer microspheres during acceleration stress
[AD-A087931] N80-33087

BLUFF BODIES
Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346

BLUNT BODIES
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32331

BOATTAILS
Afterbody drag. Volume 1: Drag of conical and circular ARC afterbodies without jet flow
[AD-A087514] N80-32341
Afterbody drag. Volume 2: Jet interference effects on subsonic boattail drag
[AD-A087515] N80-32342
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344

BODIES OF REVOLUTION
A correlation method to predict the surface pressure distribution of an infinite plate or a body of revolution from which a jet is issuing
[NASA-CR-152345] N80-32339

BODY COMPOSITION (BIOLOGY)
Metabolic aspects of caloric restriction (500 calories): Body composition changes
[AD-A082495] N80-33095

BODY KINEMATICS
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093

BODY WEIGHT
Metabolic aspects of caloric restriction (500 calories): Body composition changes
[AD-A082495] N80-33095

BODY-WING CONFIGURATIONS
Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332

BOEING 737 AIRCRAFT
Flight performance of the TCV B-737 airplane at Montreal/Dorval International Airport, Montreal, Canada, using TRSB/MLS guidance
[NASA-TM-81885] N80-32361

BOLTZMANN TRANSPORT EQUATION
Semiclassical Boltzmann transport theory in semiconductors
[AD-A084161] N80-33259

BOMBER AIRCRAFT
The US Air Service in World War I. Volume 3: The Battle of Saint Mihiel
[AD-A088294] N80-32327

BOMBS (ORDNANCE)
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344

BONDING
Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551

BOREHOLES
Technique for studying multiple fractures produced at intermediate loading rates
[UCRL-83653] N80-32797

BOUNDARY LAYER CONTROL
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351

BOUNDARY LAYER FLOW
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
Boundary-layer flow on an axisymmetric body with an inflected stern
[AD-A088526] N80-32695

BOUNDARY LAYER PLASMAS
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33228

BOUNDARY VALUE PROBLEMS
Iterative methods based upon residual averaging
N80-32762
Rapid solution of finite element equations on locally refined grids by multi-level methods
[AD-A088065] N80-33139
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176

BRANCHING (PHYSICS)
Tables of stark level transition probabilities and branching ratios in hydrogen-like atoms
[NASA-TM-82015] N80-33190

BRAZIL
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32831
Collection, processing, and distribution of remote sensing data from Brazilian Receiving Station
[INPE-1784-RPE/156] N80-32832
Planning and execution of a photographic mission over a wheat producing region in Rio Grande do Sul, Brazil
[INPE-1793-RPE/165] N80-32833
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834
Characterization of Cerrado vegetation using automatically classified LANDSAT MSS data
[INPE-1790-RPE/162] N80-32835
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32836
Remote sensing applied to the prospecting of geothermal anomaly in Caldas Novas County, State of Goias, Brazil
[INPE-1792-RPE/164] N80-32837
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053

BRAZING
Mini arc welding/brazing technique
[PB80-186497] N80-32739

BREATHING APPARATUS
The design of a fluidic oxygen intermittent demand flow device
[AD-A084083] N80-33097

BRIGHTNESS
Phosphor-penetration color cathode-ray tube
[AD-A088518] N80-32665
As-built design specification for equiprobability ellipses representation of CLASSY clusters
[E80-10320] N80-32812

BRIGHTNESS TEMPERATURE
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818
On extracting brightness temperature maps from scanning radiometer data --- techniques for algorithm design
[NASA-TM-81989] N80-32838

BRINES
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534

BRITTLE MATERIALS
Fracture toughness of brittle materials determined with chevron notch specimens
[NASA-TM-81607] N80-32486

BROADBAND
Derivation of narrowband frequency-agile radar signatures from wideband data analysis of X-band data
[AD-A088376] N80-32631

Analysis of nonlinear stochastic systems with wide-band inputs
[AD-A088243] N80-33154

BRONZES
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507

BUBBLE MEMORY DEVICES
Present and future trends in signal processing technologies
[AD-A088085] N80-32634

BUBBLES
Ignition of NOS 365 liquid propellant containing an air bubble under simulated vreech pressurization conditions
[AD-A085723] N80-32538

BUCKLING
Theoretical studies of columns under axial impact and experimental verification
[TAE-377] N80-32749

BUDGETING
Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-166] N80-33310

BUOYS
Loran-based buoy position auditing systems: Analytical evaluation
[AD-A088266] N80-32369

BURNERS
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467

BUTANES
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576

C

C BAND
Advanced communications satellites
[NASA-TM-81599] N80-32608

C-135 AIRCRAFT
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184

CABLES
Bending behavior of lapped plastic EHV cables
[BNL-27331] N80-32789

CABLES (ROPES)
Belt for transmitting power from a cogged driving member to a cogged driven member
[NASA-CASE-GSC-12289-1] N80-32717

CADMIUM SULFIDES
Development of copper sulfide/cadmium sulfide thin film solar cells
[DSE-4042-T42] N80-32931

CALCIUM
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834

CALIFORNIA
California's biomass and its energy potential
[LBL-10058] N80-32564
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
Revised Uniform Summary of Surface Weather Observations (RUSSWO) Monterey FAA, Monterey, California,, parts A, C-F
[AD-A087826] N80-33059
Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305

CALORIC REQUIREMENTS
Metabolic aspects of caloric restriction (500 calories): Body composition changes
[AD-A082495] N80-33095

CANALS
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-32846

CANCER
Energy and technology review
[UCRL-52000-80-6] N80-32909

CANOPIES (VEGETATION)
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193881] N80-32845

CANS
Reracking to increase spent fuel storage capacity, revision 1
[DOE/SR/SF-2004-REV-1] N80-33199

CAPACITANCE
A study of power and energy in the aurora modification project
[AD-A088051] N80-32637

CAPACITORS
Development of a 50 Hz, 250 kV, 500 ns, 500 KW average power pulse
[SAND-80-0491C] N80-32684

CARBIDES
Ceramic coatings on diesel engine components
[DOE/ET-15320/T1] N80-32732

CARBOHYDRATES
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544

CARBON CYCLE
Modeling the role of terrestrial ecosystems in the global carbon cycle
[CONF-800549-3] N80-32981

CARBON DIOXIDE
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972

CARBON DIOXIDE CONCENTRATION
Constraints on carbon dioxide production from fossil fuel use
[ORAU/IEA-80-9(M)] N80-32983
Occupant-generated CO2 as an indicator of ventilation rate
[LBL-10496] N80-32984

CARBON DIOXIDE LASERS
Advanced concepts in closed-cycle lasers
[AD-A088226] N80-32712

CARBON FIBER REINFORCED PLASTICS
Fracture testing of injection molded glass and carbon fiber reinforced thermoplastics
[MIT-CE-R79-4] N80-32438

CARBON FIBERS
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
A review and analysis of fiber counting methods
[AD-A088240] N80-32448

CARBON MONOXIDE
Vibrational spectra of carbon monoxide chemisorbed on alumina-supported nickel particles: A tunneling spectroscopy study
[AD-A088044] N80-32453
Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970
Methodologies to conduct regulatory impact analysis of ambient air quality standards for carbon monoxide
[PB80-192461] N80-33005
Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018
Evaluation of carbon monoxide in blood samples from the second national health and nutrition survey
[COO-4552-2] N80-33089
Studies on the removal of carbon monoxide from the atmosphere at ambient temperture --- submarine atmospheres
[AD-A085469] N80-33098
Electron-temperature dependence of dissociative recombination of electrons with CO(+)-(CO)n-series ions
[NASA-CR-163572] N80-33187
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265

CARBONIZATION
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

CARDIOGRAPHY
Cardiopulmonary data acquisition system. Version 2.0, volume 2: Detailed software/hardware documentation
[NASA-CR-160609] N80-33084

CARDIOTACHOMETERS
A microprocessor-based cardiotachometer
[NASA-CR-160607] N80-33082

CARTESIAN COORDINATES
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093

CASE HISTORIES
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462

CASSEGRAIN ANTENNAS
Diffraction of a Cassegrain antenna subreflector
[INPE-1827-RPE/193] N80-32613

CASTING
Development of a low loss magnetic composite utilizing amorphous metal flake
[CONS-3205-T1] N80-32509
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32684
Investigation of the impurity tolerance of semicrystalline silicon solar cells silicon impact program
[DOE/CH-00178-T2] N80-32934

CATALYSIS
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483
Catalytic hydrogenation of coal-derived liquids
[FE-2034-18] N80-32558
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265

CATALYSTS
Sulfur modifies the chemisorption of carbon monoxide on rhodium/alumina model catalysts
[AD-A088043] N80-32452
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A088118] N80-32457
Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472
Catalyst characterization in coal liquefaction
[SAND-80-0123] N80-32560
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32569

CATALYTIC ACTIVITY
Sulfur modifies the chemisorption of carbon monoxide on rhodium/alumina model catalysts
[AD-A088043] N80-32452
Catalyst effectiveness of high mileage in use vehicles
[PB80-192776] N80-33008
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187453] N80-33013

CATHODE RAY TUBES
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391

Phosphor-penetration color cathode-ray tube
[AD-A088518] N80-32665
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100

CATHODES
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878

CATIONS
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32569

CAUCHY PROBLEM
Parameter estimation techniques for nonlinear distributed parameter systems
[AD-A088244] N80-33153

CAVITATION FLOW
A procedure for calculation of the pressure along the axis of a tip vortex
[AD-A087667] N80-32343

CAVITY RESONATORS
Analytic approaches to unstable resonators
[AD-A088378] N80-32664

CELESTIAL NAVIGATION
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32364

CELLS (BIOLOGY)
Repair and cell cycle response in cells exposed to environmental biohazards
[ORO-4568-26] N80-32912

CELLULOSE
Automotive fuels from cellulose materials
[NZERDC-49] N80-32571
Development of cellulose flywheel rotors
[SAND-79-7099] N80-32882

CENTRAL ATLANTIC REGION (US)
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-32980

CENTRIFUGAL PUMPS
Centrifugal pump performance under simulated two-phase flow conditions
[CONF-800804-7] N80-32727

CERAMIC COATINGS
Ceramic coatings on diesel engine components
[DOE/ET-15320/T1] N80-32732

CERAMICS
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
Study of erosion mechanisms of engineering ceramics, static fatigue of ceramics
[AD-A087959] N80-32521
Glasses and glass ceramics for sealing to aluminum alloys
[SAND-79-1405C] N80-32528

CERIUM COMPOUNDS
Dip process thermal barrier coatings for superalloys
[AD-A088064] N80-32494

CH-47 HELICOPTER
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32384

CHANNEL NOISE
The reconstruction of analog signals from the sign of their noisy samples
[AD-A087650] N80-32615

CHAPARRAL
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

CHARACTER RECOGNITION
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100

CHARCOAL
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

CHARGE COUPLED DEVICES
Present and future trends in signal processing technologies
[AD-A088085] N80-32634

CHARGE EXCHANGE
Ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198

CHARGE TRANSFER
Plasma diagnostics using photon-induced charge transfer
[AD-A088228] N80-33229

CHARGED PARTICLES
Charge Measurements of particles exiting electrostatic precipitators
[PB80-187438] N80-33011
A mathematical model of electrostatic precipitation, revision 2
[PB80-190994] N80-33019

CHEMICAL ANALYSIS
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Multielement analysis of water through osmotic reduction and X-rays
[PB80-216690] N80-32482
Thermally stimulated discharge current analysis of epoxy resins
[AD-A088213] N80-32526
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
Sampling and analysis of reduced and oxidized species in process streams
[PB80-191281] N80-32994
Effective sampling techniques for particulate emissions from atypical stationary sources
[PB80-185549] N80-33010

CHEMICAL BONDS
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1762-RPE/151] N80-33253

CHEMICAL COMPOSITION
Composition and temperature dependence of shear viscosity of hydrocarbon mixtures
[AD-A088236] N80-32459

CHEMICAL ENERGY
Chemical energy storage for solar thermal conversion
[SAND-79-8198] N80-32889
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

CHEMICAL EXPLOSIONS
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534

CHEMICAL LASERS
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Chemical reactions in turbulent mixing
[AD-A088529] N80-32694
Advanced concepts in closed-cycle lasers
[AD-A088226] N80-32712
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191

CHEMICAL REACTIONS
The quantum dynamics of chemical reactions
[AD-A084243] N80-32450
Characteristic parameters in combustion processes and their accessibility to current and future diagnostics
[DOE/ER-05773/2] N80-32478
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524
The syntheses of nitrate and nitrite selective polymers
[PB80-195076] N80-32532
CdSiAs2 thin films for solar cell applications
[DOE/ET-23007/1] N80-32919
Ion chemistry in interstellar space
[NASA-CR-163580] N80-33188
Chemical reactions on solid surfaces using molecular beam techniques
[AD-A088447] N80-33266

CHEMILUMINESCENCE
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461

CHEMISORPTION
Sulfur modifies the chemisorption of carbon monoxide on rhodium/alumina model catalysts
[AD-A088043] N80-32452
Vibrational spectra of carbon monoxide chemisorbed on alumina-supported nickel particles: A tunneling spectroscopy study
[AD-A088044] N80-32453

CHIPS
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585

CHIPS (ELECTRONICS)
High contrast electroluminescent numeric readout device
[AD-A088238] N80-32674

CHROMATOGRAPHY
Identification and quantification of hydrocarbon products in effluents
[AD-A088268] N80-32454

CHROMIUM
Improving the efficiency of silicon solar cells containing chromium
[NASA-CASE-NPO-15179-1] N80-32850
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953

CHROMIUM ALLOYS
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498

CIRCUIT BOARDS
Plated-through hole testing
[BDX-613-2424] N80-32600

CIRCUIT PROTECTION
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
Coupled wave model for large magnet coils
[NASA-CR-3332] N80-32587

CIRCUIT RELIABILITY
Reliability considerations of electronics components for the deep underwater muon and neutrino detection system
[LBL-10548] N80-32744

CIRCUITS
PRANC: Program for analyzing nonlinear circuits
[AD-A088422] N80-32666

CIRCULATION CONTROL AIRFOILS
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347
Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382

CIRCUMSOLAR RADIATION
Spectral character of solar and circumsolar radiation --- for application to concentrating solar energy systems
[LBL-10802] N80-32916

CIVIL AVIATION
General aviation activity and avionics survey, 1978
[AD-A087653] N80-32325
General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354
Evaluation of safety programs with respect to the causes of general aviation accidents: Volume 1: Technical report
[AD-A087685] N80-32355
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356
Alternate waveforms for a low-cost civil global positioning system receiver
[AD-A088345] N80-32371
Initial data bank report: Fall 1978; winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372

CLASSICAL MECHANICS
The free-body diagram revisited
[AD-A087952] N80-33173

CLASSIFICATIONS
As-built design specification for equiproabability ellipses representation of CLASSY clusters
[E80-10320] N80-32812

CLEAN ENERGY
Wind characteristics program element
[PNL-3211] N80-33073

CLIMATE
Vertical velocity forced by topography in the Southern Hemisphere
[INPE-1691-RPE/119] N80-33052

CLIMATOLOGY
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
A climatological study of the tropospheric circulation over the Amazon region
[INPE-1761-RPE/150] N80-33050

Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
Revised Uniform Summary of Surface Weather Observations (RUSSWO) Monterey FAA, Monterey, California,, parts A, C-F
[AD-A087826] N80-33059

CLOSED CYCLES
Advanced concepts in closed-cycle lasers
[AD-A088226] N80-32712

CLOUD COVER
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064
Atlas of cloud-free line-of-sight probabilities. Part 5: North Africa and the Middle East
[AD-A088156] N80-33058

CLOUD PHOTOGRAPHY
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054
Weather and climate needs for Lidar observations from space and concepts for their realization — wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057

CLOUDS
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625

CLOUDS (METEOROLOGY)
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054

CLUMPS
As-built design specification for equiproabability ellipses representation of CLASSY clusters
[E80-10320] N80-32812
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814

CMOS
Accelerated life testing effects on CMOS microcircuit characteristics
[NASA-CR-161575] N80-32553

COAL
Coal combustion by wet oxidation. Wet oxidation of coal for energy production: Test plan and partial results
[DOE/ET-12328/T1] N80-32474

COAL DERIVED LIQUIDS
Catalytic hydrogenation of coal-derived liquids
[FE-2034-18] N80-32558

COAL GASIFICATION
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556
Advanced coal gasification system for electric power generation
[FE-1514-113] N80-32557
Use of an automated mass spectrometer for an underground coal gasification field test
[UCRL-84366] N80-32565
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572
Flash pyrolysis and gasification of coal through laser heating
[LA-UR-80-1094] N80-32573
Weld overlaying for corrosion resistance in coal gasification atmospheres
[FE-2621-13] N80-32726
High-temperature turbine technology program. Overall Plant Design Description (OPDD) low-Btu coal gas electric power plant
[FE-1806-83] N80-32729
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32866
Environmental assessment report: Wellman-Galusha low-Btu gasification systems
[PB80-190796] N80-32995
Sorption properties of sediments and energy-related pollutants
[PB80-189574] N80-32997

COAL LIQUEFACTION
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556
Catalyst characterization in coal liquefaction
[SAND-80-0123] N80-32560
Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32568
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32569
Coal liquefaction
[DOE/FE-0003/79-2] N80-32574
High-temperature turbine technology program. Overall Plant Design Description (OPDD) coal-derived liquid
[FE-1806-84] N80-32728

COAL UTILIZATION
Coal demonstration plants
[DOE/FE-0004/79-2] N80-32555
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723
High-temperature turbine technology program. Overall Plant Design Description (OPDD) coal-derived liquid
[FE-1806-84] N80-32728
High-temperature turbine technology program. Overall Plant Design Description (OPDD) low-Btu coal gas electric power plant
[FE-1806-83] N80-32729
A methodology for the environmental assessment of advanced coal extraction systems
[NASA-CR-163570] N80-32827
Direct electrochemical generation of electricity from coal
[SAN-0115/105-1] N80-32865
Advanced technology fuel cell program
[EPRI-EM-1328] N80-32877
Open-cycle MHD systems analysis
[EPRI-AP-1316] N80-32881
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987
Miniplant and bench studies of pressurized fluidized-bed coal combustion
[PB80-186121] N80-32999
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating --- coal combustion product environments
[NASA-TM-81555] N80-33221

COASTAL PLAINS
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054

COATING
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933

COATINGS
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
Optical coatings for laser fusion applications
[UCRL-83582] N80-33236
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276

COAXIAL CABLES
Transmission of 565 Mbit/s signals via coaxial cables
[BLL-RDL-TRANS-3793-(7737.470)] N80-32606
Analysis of a finite length tubular monopole antenna driven by a coaxial line
[SAND-79-1557] N80-32647
Admittance of an infinitely long monopole antenna immersed in a dissipative medium and driven by an airfilled coaxial line
[SAND-79-1401] N80-32648

COAXIAL FLOW
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177

COCKPIT SIMULATORS
Preliminary evaluation of time and distance spacing cues using a cockpit displayed target
[NASA-TM-81794] N80-32362

CODING
The microwave applications theory program at NRL and some chemistry code applications to ionospheric heating by microwave radiation
[AD-A088275] N80-33039
Microcode verification project
[AD-A088189] N80-33110
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33262

COGENERATION
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating --- coal combustion product environments
[NASA-TM-81555] N80-33221

COKE
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483

COLLISION AVOIDANCE
NASA aviation safety reporting system
[NASA-TM-81197] N80-32352
FAA's collision-avoidance program
[GPO-40-611] N80-32365

COLLISIONS
Plastic deformation of colliding hemishells
[LA-UR-80-1659] N80-32794

COLOR TELEVISION
Phosphor-penetration color cathode-ray tube
[AD-A088518] N80-32665

COLORADO
Paleontological resources evaluation: West Divide Project
[PB80-189689] N80-32846
Colorado General Assembly science and technology resource needs assessment study
[PB80-189491] N80-33299

COLUMNS (SUPPORTS)
Theoretical studies of columns under axial impact and experimental verification
[TAE-377] N80-32749
Post-buckling behavior of a beam-column on a nonlinear elastic foundation with a gap N80-32767

COMBUSTION
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-14] N80-32475
Combustion: Structural interaction in a viscoelastic material N80-32781

COMBUSTION CHAMBERS
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2689-T4] N80-32543
Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731

COMBUSTION EFFICIENCY
Performance deterioration of commercial high-bypass ratio turbofan engines
[NASA-TM-81552-REV] N80-32394
The energy efficient engine project
[NASA-TM-81566] N80-32395

Coal combustion by wet oxidation. Wet oxidation of coal for energy production: Test plan and partial results
[DOE/ET-12326/T1] N80-32474
Comparison of coherent and spontaneous Raman combustion diagnostics
[SAND-80-8616] N80-32477
Characteristic parameters in combustion processes and their accessibility to current and future diagnostics
[DOE/ER-05773/2] N80-32478
Potential of diesel engine, emission technology
[PB80-192685] N80-32735
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012

COMBUSTION PHYSICS
Miniplant and bench studies of pressurized fluidized-bed coal combustion
[PB80-188121] N80-32999

COMBUSTION PRODUCTS
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976
Catalyst effectiveness of high mileage in use vehicles
[PB80-192776] N80-33008

COMBUSTION TEMPERATURE
Investigation of CARS and laser-induced saturated fluorescence for practical combustion diagnosis
[PB80-190515] N80-32479

COMETS
Interference filter photometry of periodic comet Ashbrook-Jackson
[NASA-CR-163581] N80-33318

COMMAND AND CONTROL
Development and evaluation of an emissions control decision aid
[AD-A087358] N80-32621

COMMERCIAL AIRCRAFT
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

COMMERCIAL ENERGY
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942

COMMUNICATING
Complexity of storage and retrieval problems
[AD-A088319] N80-33296

COMMUNICATION CABLES
Fiber optic communication links
[SAND-80-1290C] N80-33220

COMMUNICATION SATELLITES
Advanced communications satellites
[NASA-TM-81599] N80-32608
A quantitative analysis of inter-island telephony traffic in the Pacific Basin Region (PBR)
[NASA-TM-81587] N80-32610

COMMUNICATIONS TECHNOLOGY SATELLITE
CTS attenuation and cross polarization measurements at 11.7 GHz
[NASA-CR-160025] N80-32612
Depriming of arterial heat pipes: An investigation of CTS thermal excursions
[NASA-CR-165153] N80-32688

COMMUNITIES
Data resources in housing and urban development
[PB80-188071] N80-33302

COMPACTING
The effect of compacted prestress on compacted shale compressibility
[PB80-191158] N80-32602

COMPARISON
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071

COMPILERS
Compiling fast partial derivatives of functions given by algorithms
[COO-2383-0063] N80-33145

COMPONENT RELIABILITY
Reliability considerations of electronics components for the deep underwater muon and neutrino detection system
[LBL-10548] N80-32744

COMPOSITE MATERIALS
Advanced structures maintenance concepts
[AD-A087609] N80-32324
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
Flaw detection and evaluation of composite cylinders using laser speckle interferometry and holography
[AD-A088206] N80-32447
Development of a low loss magnetic composite utilizing amorphous metal flake
[CONS-3205-T1] N80-32509
Mechanical properties of high-current multifilamentary Nb3Sn conductors
[UCRL-84040] N80-32682
Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910
Percolation and electrical conduction in superconducting composites
[AD-A088196] N80-33271
A-15 superconducting composites in the 0.1 micron region — casting alloys for magnet wire
[IS-M-274] N80-33274

COMPOSITE STRUCTURES
Advanced structures concepts r and m/cost assessments — helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374
Stability optimization of laminated composite plates
[ISAS-579-VOL-45-NO-4] N80-32442

COMPOSITION
Hydrogen production by photoelectrolytic decomposition of H2O using solar energy
[NASA-CR-163586] N80-32854

COMPRESSED AIR
Porous media experience applicable to field evaluation for compressed air energy storage
[PNL-3294] N80-32873

COMPRESSED GAS
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678

COMPRESSIBILITY
The effect of compacted prestress on compacted shale compressibility
[PB80-191158] N80-32602

COMPRESSING
Finite element stress analysis of a compression mold
[BDX-613-2387] N80-32801

COMPRESSION LOADS
Shock compression of tantalum
[AD-A088152] N80-32499

COMPRESSIVE STRENGTH
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437
Shock compression of tantalum
[AD-A088152] N80-32499

COMPRESSOR BLADES
Isothermal roll forging of T55 compressor blades, phase 2
[AD-A088076] N80-32495

COMPRESSORS
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
Assessment of hydrogen compressor technology for energy storage and transmission systems
[ORO-5598-T1] N80-32922

COMPTON EFFECT
Total gamma absorption telescope with multiparametric analysis
[INPE-1804-RPE/172] N80-33321

COMPUTATION
Computation of three-dimensional supersonic viscous flows in internal corners
[AD-A085657] N80-32345
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087564] N80-33111

COMPUTATIONAL FLUID DYNAMICS
Theoretical calculation of viscous-inviscid transonic flows
[AD-A087745] N80-32346

COMPUTER COMPATIBLE TAPES
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32613
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32626

COMPUTER GRAPHICS
Elastic wave propagation through multilayered media
[AD-A088030] N80-32636
Evaluation of remote sensing techniques on selected forest sites in Florida — Fort Myers and Gainesville test sites
[E80-10296] N80-32605
As-built design specification for equiprobability ellipses representation of CLASSY clusters
[E80-10320] N80-32612
Psychophysical criteria for visual simulation systems. Phase 2: Experimental investigations of display joints and scene inserts
[AD-A088316] N80-33091
Computer-assisted chart making from the graphic designer's perspective
[LBL-10239] N80-33115
Remote hard copy. Volume 2: Operating manual
[SAND-80-0538/2] N80-33297
Remote hard copy. Volume 1: Programming manual
[SAND-80-0538/1] N80-33298

COMPUTER INFORMATION SECURITY
Security and privacy in the 80's
[RAND/P-6492] N80-33291

COMPUTER NETWORKS
Distributed network protocols
[AD-A087623] N80-33117
Fault tolerant computer network study
[AD-A088066] N80-33118
Multiple access mass storage network
[UCRL-83929] N80-33119
Remote hard copy. Volume 2: Operating manual
[SAND-80-0538/2] N80-33297
A plan for a system to provide developmental information in Africa
[PB80-189806] N80-33315

COMPUTER PROGRAMMING
Computational and simplified analytical treatment of transonic wing-fuselage-pylon-store interactions
[AD-A085619] N80-32363
Microcode verification project
[AD-A088189] N80-33110
Knowledge acquisition, knowledge programming, and knowledge refinement
[RAND/R-2540-NSF] N80-33120
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293
Remote hard copy. Volume 1: Programming manual
[SAND-80-0538/1] N80-33298

COMPUTER PROGRAMS
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363
Cooperative estimation of targets by multiple aircraft
[AD-A085798] N80-32366
Helicopter dynamic performance program. Volume 2: User's manual
[AD-A088318] N80-32367
Guidance and control of tactical missiles
[AD-A085147] N80-32422

User's guide for the Flight Design System (FDS)
[NASA-TM-82202] N80-32426
Advanced fluid system simulation
[AD-A086080] N80-32522
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551
Metrology data reduction system: PDP-11/34 computer system
[BDX-613-2402] N80-32599
Development and evaluation of an emissions control decision aid
[AD-A087358] N80-32621
A computer program to analyze spread-spectrum system performance
[AD-A084179] N80-32624
Derivation of narrowband frequency-agile radar signatures from wideband data analysis of X-band data
[AD-A088376] N80-32631
PRANC: Program for analyzing nonlinear circuits
[AD-A089422] N80-32666
Mechanical properties of high-current multifilamentary Nb3Sn conductors
[UCRL-84040] N80-32682
Thermal radiation analysis system TRASYS 2: User's manual
[NASA-CR-159273-1] N80-32690
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691
FLUOMEG: A planar finite difference mesh generator for fluid flow problems with parallel boundaries
[ORNL/TM-7116] N80-32697
Automating the E-beam laser
[AD-A079529] N80-32709
Development of flexible rotor balancing criteria
[NASA-CR-159508] N80-32720
Computational strategy for the solution of large strain nonlinear problems using the Wilkins explicit finite-difference approach N80-32763
Study of solution procedures for nonlinear structural equations N80-32765
A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A086375] N80-32780
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32808
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
High Density Tape Reformatting System/LANDSAT Imagery Verification and Extraction System (HDTRS/LIVES) production test throughput analysis
[E80-10319] N80-32811
As-built design specification for equiprobability ellipses representation of CLASSY clusters
[E80-10320] N80-32812
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814
As-built design specification for a list processing system
[E80-10325] N80-32816
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
Preliminary estimate of regional effective ground-water recharge rates, related stream flow and water quality in Ohio
[PB80-193535] N80-32842
A computer model of solar panel-plasma interactions
[NASA-CR-160796] N80-32853
User's manual for the vertical axis wind turbine performance computer code darter
[SAND-80-1106] N80-32872
Solar index generation and delivery
[DOE/ET-20090/3] N80-32929
User's manual for hydrological simulation program: FORTRAN (HSPF)
[PB80-191109] N80-33004
Data processing support for experimental studies of the upper atmosphere
[AD-A087943] N80-33034
A microprocessor-based cardiotachometer
[NASA-CR-160607] N80-33082
Cardiopulmonary data acquisition system. Version 2.0, volume 1: User's guide
[NASA-CR-160608] N80-33083
Nonanalytic function generation routines for 16-bit microprocessors
[NASA-TM-81586] N80-33104
Computer treatment of perspective for solids
[INPE-1795-RPE/157] N80-33105
Estimation of the P(CS) with a computer program, revision
[AD-A088058] N80-33108
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087564] N80-33111
Development of software for computer assisted model simplification
[DOE/EIA-10597/T1] N80-33112
Methods to insure the standardization of FORTRAN software
[ORNL/CSD/TM-95] N80-33113
THOR: A post-processor for two-dimensional analysis codes
[UCRL-52852] N80-33114
Computer program to add nosemap grids of different spacings
[AD-A088205] N80-33185
Computer code for the atomistic simulation of lattice defects and dynamics
[HEDL-TME-78-55-VOL-2] N80-33273
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33292

COMPUTER STORAGE DEVICES
Multiple access mass storage network
[UCRL-83929] N80-33119

COMPUTER SYSTEMS DESIGN
Microcomputer system for medium-sized and experimental finite element analysis N80-32776
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
Multiple access mass storage network
[UCRL-83929] N80-33119

COMPUTER SYSTEMS SIMULATION
Advanced SMITE reference manual
[AD-A087743] N80-33108

COMPUTER TECHNIQUES
Compiling fast partial derivatives of functions given by algorithms
[COO-2383-0063] N80-33145
Future directions for decision support
[AD-A087365] N80-33399

COMPUTERIZED DESIGN
Development of software for computer assisted model simplification
[DOE/EIA-10597/T1] N80-33112

COMPUTERIZED SIMULATION
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152385] N80-32338
A demonstration of satellite shielding
[AD-A087752] N80-32421
Guidance and control of tactical missiles
[AD-A085147] N80-32422
Modelling of environmentally induced discharges in geosynchronous satellites
[NASA-TM-81598] N80-32428
Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
Advanced fluid system simulation
[AD-A086080] N80-32522
Multiple Threat Generator (MTG-100)
[AD-A087477] N80-32622
Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32652
Numerical simulation of reactive flow in internal combustion engines
[LA-UR-80-1630] N80-32730
On-line direct digital control extrusion process
[PB80-196499] N80-32738
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A089335] N80-32785
Fluid temperature control for parabolic trough solar collectors
[SAND-79-2006C] N80-32894
Development of an energy consumption and cost data base for fuel cell total energy systems and conventional building energy systems
[ORNL/CON-38] N80-32960
User's manual for hydrological simulation program: FORTRAN (HSPF)
[PB80-191109] N80-33004
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33038
Numerical simulation of the influence of sea-surface temperature on translating tropical cyclones
[AD-A089050] N80-33067
PROCRU: A model for analyzing crew procedures in approach to landing
[NASA-CR-152397] N80-33090
Human performance in continuous operations. Volume 3: Technical documentation
[AD-A089339] N80-33092
A generalized decision support system using predicate calculus and network data base management
[AD-A089079] N80-33166
Computer program to add nosemap grids of different spacings
[AD-A088205] N80-33185
Plasma theory and simulation
[AD-A088331] N80-33224
Computer code for the atomistic simulation of lattice defects and dynamics
[HEDL-TME-78-55-VOL-2] N80-33273

CONCENTRATION (COMPOSITION)
Investigation of CARS and laser-induced saturated fluorescence for practical combustion diagnosis
[PB80-190515] N80-32479
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32931
Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-560-VOL-45-NO-5] N80-33251

CONCENTRATORS
Fundamentals and techniques of nonimaging optics for solar energy concentration
[DOE/ER-04657/2] N80-32896
Spectral character of solar and circumsolar radiation — for application to concentrating solar energy systems
[LBL-10802] N80-32916
Concentrating photovoltaic for the Tropics
[DOE/CS-04270/1] N80-32954

CONCRETE STRUCTURES
Explosive demolition of activated concrete
[CONF-800542-4] N80-32587
Analysis of reinforced concrete structures with occurrence of discrete cracks at arbitrary positions N80-32757
Computational models for the nonlinear analysis of reinforced concrete plates N80-32758

CONCRETES
A proposed generalized constitutive equation for nonlinear para-isotropic materials N80-32769

CONDENSING
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473

CONDUCTIVE HEAT TRANSFER
Kinetic-theory description of electron heat transfer in a plasma
[NSWW-801145-1] N80-33232

CONFERENCES
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-33414
Low-cost solar array project and Proceedings of the 10th Project Integration Meeting
[NASA-CR-163566] N80-33002
Proceedings: Advances in Particle Sampling and Measurement
[PB80-187497] N80-33014
Proceedings of D+ Particle Beam Research Workshop
[AD-A086159] N80-33198
Symposium on International Standards Information and ISONET
[PB80-197221] N80-33304
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316
CONFIDENCE LIMITS
Asymptotically distribution-free simultaneous confidence region of treatment differences in a randomized complete block design
[AD-A086115] N80-33136
Confidence intervals on nonnegative linear combinations of variances
[AD-A084194] N80-33151
A robust confidence interval for samples of five observations
[AD-A086071] N80-33161
CONGRESSIONAL REPORTS
FAA's collision-avoidance program
[GPO-40-611] N80-32365
First report to Congress on the use of alcohol in motor fuels
[DOE/CS-0185] N80-32546
NASA authorization, 1980, volume 2, part 2
[GPO-46-070] N80-33309
Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-166] N80-33310
NASA authorization for fiscal year 1979, part 1
[GPO-35-020] N80-33311
CONICAL BODIES
Afterbody drag. Volume 1: Drag of conical and circular ARC afterbodies without jet flow
[AD-A087514] N80-32941
CONICAL FLOW
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32338
CONICS
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32338
CONSERVATION
Technique for measuring partly nonconservation in hydrogenic atoms
[DOE/ER-01398-444] N80-33193
CONSOLIDATION
Rapid solidification processing: An outlook
[AD-A085473] N80-33284
CONSTRAINTS
STS-1 operational flight profile. Volume 1: Ground rules and constraints cycle 3.1.1.
[NASA-TM-82250] N80-32427
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127
CONSUMERS
Environmental assessment: Energy efficiency standards for consumer products
[DOE/CS-0188] N80-32988
CONTAMINANTS
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534
Microcosms as potential screening tools for evaluating transport and effects of toxic substances
[ORNL/EPA-4] N80-32979
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012
CONTINUITY (MATHEMATICS)
Semistable laws on topological vector spaces
[AD-A086204] N80-33143
CONTINUUM MECHANICS
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334
CONTINUUMS
Thermodynamic properties of solid helium using an anharmonic anisotropic continuum model
[DOE/ER-01198/1314] N80-32598
CONTROL EQUIPMENT
On-line direct digital control extrusion process
[PB80-195489] N80-32736
CONTROL SURFACES
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A086140] N80-32351
CONTROL THEORY
Approximation schemes for the linear-quadratic optimal control problem associated with delay equations
[AD-A086245] N80-33121
The Riccati integral equation arising in optimal control of delay differential equations
[AD-A086097] N80-33122
Identification of nonlinear delay systems using spline methods
[AD-A086251] N80-33134
Fundamental algorithms for concurrency control in distributed data base systems
[AD-A087996] N80-33294
CONTROLLED FUSION
Tokamak poloidal field systems
[LA-8375-PR] N80-33233
Plasma confinement experiments in the TMX tandem mirror
[UCRL-83815] N80-33241
Tandem mirror reactors with thermal barriers
[UCRL-83905] N80-33244
CONVECTIVE HEAT TRANSFER
Design and operation of thermal convection loops for corrosion testing in molten NaNO3-KNO3 --- solar-thermal conversion
[SAND-80-8212] N80-32501
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
Analysis of a passive heat pipe cooled solar photovoltaic receiver
[SAND-80-7011] N80-32885
Line-focus solar central power system, phase 1. Subsystem experiment: Receiver heat transfer
[DOE/ET-20550/1] N80-32945
CONVERGENCE
On the almost sure convergence of weighted sums of random elements in D(0, 1)
[AD-A086330] N80-33144
CONVERGENT-DIVERGENT NOZZLES
Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N80-32392
CONVOLUTION INTEGRALS
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A086276] N80-32632
On the first passage time distribution for a class of Markov chains
[AD-A086111] N80-33159
COOLANTS
Centrifugal pump performance under simulated two-phase flow conditions
[CONF-800804-7] N80-32727
COOLERS
Magnetic refrigeration for space applications
[LA-UR-80-1596] N80-32596
COOLING
A study of transient ablation of blunt bodies
[ISAS-591-VOL-45-NO-6] N80-32331
Depinning of arterial heat pipes: An investigation of CTS thermal excursions
[NASA-CR-165153] N80-32688
Analysis of a passive heat pipe cooled solar photovoltaic receiver
[SAND-80-7011] N80-32885
COOLING SYSTEMS
Low-temperature solder for joining large cryogenic structures --- cooling coils for the National Transonic Facility
[NASA-TM-81936] N80-32490
Magnetic refrigeration for space applications
[LA-UR-80-1596] N80-32596
Operator manual: High temperature heat pump
[DOE/CS-40193/T1] N80-32902
COORDINATES
Coordinates of features on the Galilean satellites
[NASA-CR-163582] N80-33326
COPOLYMERIZATION
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524
COPOLYMERS
Synthesis and characterization of new silicone condensation polymers
[UCRL-84304] N80-32530
COPPER
Plated-through hole testing
[BDX-613-2424] N80-32800
COPPER OXIDES
Thermal conductivity of consolidated Al/Cu2O thermites
[MLM-2698] N80-32503
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32915
Cuprous oxide photovoltaic cells
[DOE/ET-23010/17] N80-32932
COPPER SULFIDES
Development of copper sulfide/cadmium sulfide thin film solar cells
[DSE-4042-T42] N80-32931
CORN
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
Liquid fuels production from biomass --- corn and algae
[COO-4388-10] N80-32545
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818
CORRELATION
A correlation method to predict the surface pressure distribution of an infinite plate or a body of revolution from which a jet is issuing
[NASA-CR-152345] N80-32339
CORRELATION DETECTION
Interferometric locating system
[NASA-CASE-NPO-14173-1] N80-32359
CORROSION
Fundamentals of corrosion fatigue behavior of metals and alloys
[AD-A088358] N80-32496
Initial stages of oxidation of metals and alloys
[DOE/ER-10501/1] N80-32500
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508
Crack tip plasticity associated with corrosion assisted fatigue --- low carbon steel
[AD-A087961] N80-32783
Study program for encapsulation materials interface for low cost silicon solar array
[NASA-CR-163563] N80-32857
CORROSION PREVENTION
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
Parameter monitoring for corrosion control of utility gas turbines
[EPRI-AP-1369] N80-32504
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512
CORROSION RESISTANCE
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385
Design and operation of thermal convection loops for corrosion testing in molten NaNO3-KNO3 --- solar-thermal conversion
[SAND-80-8212] N80-32501
Weld overlaying for corrosion resistance in coal gasification atmospheres
[FE-2621-13] N80-32726
COSMIC RAYS
Ion production in the D-region --- through cosmic rays during solar flares and geomagnetic storms
[AD-A085533] N80-33036

Scale size of the cosmic ray modulating region
[INPE-1826-RPE/192] N80-33331
Heavy weak bosons, cosmic antimatter and DUMAND. 2: Looking for cosmic antimatter with DUMAND
[NASA-TM-82017] N80-33333
Anomalous isotopic composition of cosmic rays
[UCRL-84561] N80-33335

COST ANALYSIS
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
Mini arc welding/brazing technique
[PB80-186497] N80-32739
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Costing methodologies for energy systems
[BNL-27603] N80-32900
Environmental assessment report: Wellman-Galusha low-Btu gasification systems
[PB80-190796] N80-32995
Complexity of storage and retrieval problems
[AD-A088319] N80-33296

COST EFFECTIVENESS
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-32414

COST ESTIMATES
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Orbit transfer vehicle engine study. Volume 3: Program costs
[NASA-CR-161574] N80-32433
Use of solar energy to produce process heat for industry
[SERI/TP-731-626] N80-32863
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928

COST REDUCTION
Biotechnology for a renewable resources chemicals and fuels industry, biochemical engineering R and D
[SERI/TP-621-659] N80-32561
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852
Operation and maintenance cost data for residential photovoltaic modules/panels
[NASA-CR-163585] N80-32855

COTTON
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

COULOMB COLLISIONS
Interaction of radiation with matter.
[DOE/EV-02386/1] N80-32436

COVARIANCE
Potential coefficient and anomaly degree variance modelling revisited
[AD-A082322] N80-33023
Some graphical considerations in time series analysis
[AD-A088246] N80-33131

CRACK INITIATION
Consistent stress-strain ductile fracture model as applied to two grades of beryllium
[SAND-79-2126] N80-32793

CRACK PROPAGATION
Neutron irradiation effects on fatigue crack propagation in type 316 stainless steels at 649 deg C
[AD-A088052] N80-32493
Fracture toughness testing of HDPE plastic pipe
[MIT-CE-R79-5] N80-32751
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088278] N80-32782
Crack tip plasticity associated with corrosion assisted fatigue — low carbon steel
[AD-A087961] N80-32783
Dynamic mixed mode fracture — stress intensity factors
[AD-A088287] N80-32784
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A088335] N80-32785
Technique for studying multiple fractures produced at intermediate loading rates
[UCRL-83653] N80-32797
In-reactor fatigue crack propagation
[HEDL-SA-1927] N80-32803
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024

CRACKING (CHEMICAL ENGINEERING)
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32589

CRACKING (FRACTURING)
Analysis of reinforced concrete structures with occurrence of discrete cracks at arbitrary positions N80-32757
Computational models for the nonlinear analysis of reinforced concrete plates N80-32758

CRACKS
Boundary integral equation method for fracture problems with mixed mode deformations
[ORNL/CSD-57] N80-33146

CRASH LANDING
General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354

CRASHES
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

CREEP ANALYSIS
Long-time creep behavior of the tantalum alloy Astar 811C — as a function of stress, temperature, and grain size
[NASA-TP-1691] N80-32489
A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A088375] N80-32760

CREEP RUPTURE STRENGTH
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488

CREEP TESTS
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32802

CRITERIA
Development of flexible rotor balancing criteria
[NASA-CR-159506] N80-32720

CRITICAL POINT
Analysis of liquid volume and liquid mass fractions at coexistence for pure fluids
[PB80-191133] N80-32481

CROP GROWTH
Production of sugarcane and tropical grasses as a renewable energy source
[DOE-ET-20071/T1] N80-32546
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Planning and execution of a photographic mission over a wheat producing region in Rio Grande do Sul, Brazil
[INPE-1793-RPE/165] N80-32833

CROP IDENTIFICATION
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling — Corn Belt
[E80-10327] N80-32818
Applied Remote Sensing Program (ARSP) — Arizona
[E80-10330] N80-32821

CROP INVENTORIES
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
As-built design specification for CCITS processor program
[E80-10323] N80-32814
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

CROSS POLARIZATION
CTS attenuation and cross polarization measurements at 11.7 GHz
[NASA-CR-160025] N80-32612

CROSSLINKING
Method of cross-linking polyvinyl alcohol and other water soluble resins
[NASA-CASE-LEW-13103-1] N80-32516

CRUDE OIL
Characteristics of insulating oil for electrical application
[EPRI-EL-1300] N80-32681
Energy and technology review
[UCRL-52000-80-6] N80-32909
International energy indicators
[DOE/IA-0010] N80-32918
Potential displacement of petroleum imports by solar energy technologies
[SERI/TR-352-504] N80-32959

CRUSTAL FRACTURES
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033

CRYODEPOSITS
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214

CRYOGENIC COOLING
Support assembly for cryogenically coolable low-noise choke waveguide
[NASA-CASE-NPO-14253-1] N80-32605

CRYOGENIC EQUIPMENT
Acoustic microscopy at cryogenic temperatures
[AD-A087677] N80-32589

CRYOGENIC FLUIDS
Comparative thermal analysis of alternate Cryogenic Fluid Management Experiment (CFME) configurations
[NASA-CR-165151] N80-32412

CRYOGENIC WIND TUNNELS
Modeling and control of transonic cryogenic wind tunnels
[NASA-CR-163588] N80-32403
Low-temperature solder for joining large cryogenic structures — cooling coils for the National Transonic Facility
[NASA-TM-81836] N80-32490

CRYOGENICS
High toughness-high strength iron alloy
[NASA-CASE-LEW-12542-3] N80-32484
Multispectral scanner optical system
[NASA-CASE-MSC-18255-1] N80-33210

CRYSTAL DEFECTS
Interactions between small polaronic particles in solids
[SAND-80-0486C] N80-33194
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254
Computer code for the atomistic simulation of lattice defects and dynamics
[HEDL-TME-78-55-VOL-2] N80-33273

CRYSTAL DISLOCATIONS
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
High angle grain boundaries as sources or sinks for point defects
[DOE/ER-05002/8] N80-33279

CRYSTAL GROWTH
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875

Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32884
Crystal growth by skull melting
[AD-A088013] N80-33269
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276

CRYSTAL LATTICES
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A086335] N80-32785
Self-consistent APW-k-vector, p vector method. 1: Theory
[INPE-1763-RPE/152] N80-33252

CRYSTAL OPTICS
Integrated optical logic gates. A demonstration of four optical logic functions
[AD-A087999] N80-33215

CRYSTAL OSCILLATORS
The effect of vibration on quartz crystal resonators
[AD-A085642] N80-32677

CRYSTAL STRUCTURE
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924

CRYSTALLIZATION
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257

CURRENT DENSITY
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006

CURVE FITTING
The off-line use of a sequential estimator
[AD-A088178] N80-33142

CURVES (GEOMETRY)
Some graphical considerations in time series analysis
[AD-A088246] N80-33131

CUTTING
Conventional machining of ESR 4340 steel
[AD-A088451] N80-32591

CV-990 AIRCRAFT
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047

CYCLONES
An atlas of 1977 and 1978 GEOS-3 radar altimeter data for tropical cyclone studies
[NASA-TM-73288] N80-33046
Numerical simulation of the influence of sea-surface temperature on translating tropical cyclones
[AD-A088050] N80-33067

CYCLOTRON RESONANCE
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227

CYLINDRICAL BODIES
Afterbody drag. Volume 1: Drag of conical and circular ARC afterbodies without jet flow
[AD-A087514] N80-32341

CYLINDRICAL SHELLS
On the constitutive laws for the large strain cylindrical deformations of shells
[TAE-370] N80-32750

CYTOCHROMES
Structure and function in photosynthetic membranes and their components
[COO-3162-51] N80-33078

D

D REGION
Ion production in the D-region --- through cosmic rays during solar flares and geomagnetic storms
[AD-A085533] N80-33038

DAMAGE ASSESSMENT
Advanced structures maintenance concepts
[AD-A087609] N80-32324

DAMPING
Development of procedures for calculating stiffness and damping of elastomers in engineering applications, part 7
[NASA-CR-165136] N80-32718
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786

DARK ADAPTATION
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391

DATA ACQUISITION
Automating the E-beam laser
[AD-A079529] N80-32709
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970
An atlas of 1977 and 1978 GEOS-3 radar altimeter data for tropical cyclone studies
[NASA-TM-73288] N80-33046
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
Cardiopulmonary data acquisition system. Version 2.0, volume 1: User's guide
[NASA-CR-160608] N80-33083
Cardiopulmonary data acquisition system. Version 2.0, volume 2: Detailed software/hardware documentation
[NASA-CR-160609] N80-33084
A plan for a system to provide developmental information in Africa
[PB80-189806] N80-33315

DATA BASES
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32336
Initial data bank report: Fall 1978; winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372
System description for the Airborne-Omega Data Bank
[AD-A087606] N80-32373
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32828
Fundamental algorithms for concurrency control in distributed data base systems
[AD-A087996] N80-33294

DATA CORRELATION
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149

DATA LINKS
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366
Discrete Address Beacon System (DABS) front end processor en route central computer complex protocol
[AD-A085482] N80-32367

DATA MANAGEMENT
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
Data quality indicators and their use in data base systems
[RAND/P-6491] N80-33292

DATA PROCESSING
System description for the Airborne-Omega Data Bank
[AD-A087606] N80-32373
Derivation of narrowband frequency-agile radar signatures from wideband data analysis of X-band data
[AD-A088376] N80-32631
Seasat-A land applications data processing plan
[E80-10317] N80-32810
High Density Tape Reformatting System/LANDSAT Imagery Verification and Extraction System (HDTRS/LIVES) production test throughput analysis
[E80-10319] N80-32811
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814
On extracting brightness temperature maps from scanning radiometer data --- techniques for algorithm design
[NASA-TM-81969] N80-32838
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970
Data processing support for experimental studies of the upper atmosphere
[AD-A087943] N80-33034
Computer treatment of perspective for solids
[INPE-1785-RPE/157] N80-33105
Data quality indicators and their use in data base systems
[RAND/P-6491] N80-33292
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293
Fundamental algorithms for concurrency control in distributed data base systems
[AD-A087996] N80-33294

DATA REDUCTION
Metrology data reduction system: PDP-11/34 computer system
[BDX-613-2402] N80-32599
Accelerated life tests and information
[AD-A088014] N80-32741
Some graphical considerations in time series analysis
[AD-A088246] N80-33131
Interference filter photometry of periodic comet Ashbrook-Jackson
[NASA-CR-163581] N80-33318

DATA RETRIEVAL
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
Microcomputer-based natural-language understanding, phase 1
[PB80-187370] N80-33116
Complexity of storage and retrieval problems
[AD-A088319] N80-33296

DATA SAMPLING
Detecting change points in sampling from multinomial distributions
[AD-A087898] N80-33150

DATA SMOOTHING
The off-line use of a sequential estimator
[AD-A088178] N80-33142

DATA STORAGE
Recording media archival attributes (magnetic)
[AD-A088187] N80-32704
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
Cardiopulmonary data acquisition system. Version 2.0, volume 1: User's guide
[NASA-CR-160608] N80-33083
SlideStore large capacity information storage
[PB80-187875] N80-33103
Multiple access mass storage network
[UCRL-83929] N80-33119
Data quality indicators and their use in data base systems
[RAND/P-6491] N80-33292
Complexity of storage and retrieval problems
[AD-A088319] N80-33296

DATA SYSTEMS
High contrast electroluminescent numeric readout device
[AD-A088238] N80-32674
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755
Cardiopulmonary data acquisition system. Version 2.0, volume 2: Detailed software/hardware documentation
[NASA-CR-160609] N80-33084

Data resources in housing and urban development
[PB80-168071] N80-33302

DATA TRANSMISSION

A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856

Distributed network protocols
[AD-A087623] N80-33117

DC 10 AIRCRAFT

Engine bleed air reduction in DC-10
[NASA-CR-159846] N80-32378

DEACTIVATION

Luminescent tellurium-doped cadmium sulfide electrodes as probes of semiconductor excited-state deactivation processes in photoelectrochemical cells
[AD-A088532] N80-32451

DECAY RATES

Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222

DECISION MAKING

Development and evaluation of an emissions control decision aid
[AD-A087358] N80-32621

A generalized decision support system using predicate calculus and network data base management
[AD-A088079] N80-33186

Future directions for decision support
[AD-A087355] N80-33289

Developing science and technology resources for the Governor, of the Ohio Science, Engineering and Technology Program for executive agencies
[PB80-190101] N80-33300

The Science, Engineering, and Technology Program for the New Jersey Executive Branch
[PB80-190242] N80-33301

Creating a science and technology information capacity for the Executive and Legislative Branches of the Delaware State Government
[PB80-190762] N80-33303

Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305

The State Science, Engineering and Technology program in North Carolina, study phase
[PB80-190846] N80-33307

DECOMPOSITION

Determination of kinetic parameters for thermal decomposition of phenolic ablative materials by multiple heating rate method
[AD-A087929] N80-32443

Biological degradation of hydrazine
[AD-A084426] N80-32536

DECONDITIONING

The development of an elastic reverse gradient garment to be used as a countermeasure for cardiovascular deconditioning
[NASA-CR-152379] N80-33088

DECONTAMINATION

Explosive demolition of activated concrete
[CONF-800542-4] N80-32597

DEEP SPACE NETWORK

Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317

DEER

Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32626

DEFORESTATION

The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32636

DEFORMATION

Permanent deformation of flexible pavements
[AD-A087859] N80-32588

On the constitutive laws for the large strain cylindrical deformations of shells
[TAE-370] N80-32750

Research in nonlinear structural and solid mechanics
[NASA-CP-2147] N80-32756

Combustion: Structural interaction in a viscoelastic material N80-32761

Computational strategy for the solution of large strain nonlinear problems using the Wilkins explicit finite-difference approach N80-32763

Solutions of contact problems by the assumed stress hybrid model N80-32771

DEGRADATION

Biological degradation of hydrazine
[AD-A084426] N80-32536

DEICING

Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32601

DELAMINATING

Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754

DELAY LINES

S and Ku band frequency source development
[NASA-CR-160033] N80-32654

DELTA WINGS

Transonic pitch damping of a delta wing aircraft determined from flight measurements
[AD-A087771] N80-32381

DEMAND (ECONOMICS)

Documentation of volume 3 of the 1978 Energy Information Administration annual report to congress
[DOE/EIA-CR-0456] N80-32869

DENMARK

HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

DENSITY MEASUREMENT

On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088082] N80-33076

DEOXYRIBONUCLEIC ACID

Repair and cell cycle response in cells exposed to environmental biohazards
[ORO-4588-26] N80-32912

DEPOSITION

Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/4] N80-32820

Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32825

Fusion product deposition and energy balance
[UCID-18710] N80-33204

DERIVATION

Compiling fast partial derivatives of functions given by algorithms
[COO-2383-0063] N80-33145

DESIGN ANALYSIS

A simplified digital filter design
[AD-A087772] N80-32658

Potential of spark ignition engine, effect of vehicle design variables on top speed, performance, and fuel economy
[PB80-191836] N80-32738

Silicon concentrator solar cell manufacturing development
[SAND-80-7018] N80-32886

Engineering test facility conceptual design --- for magnetohydrodynamic generators
[DOE/FE-2614/3] N80-32943

Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015

DETERIORATION

Weathering tests on protective helmets approved to Australian standard AS 1698, for vehicle users
[AD-A084232] N80-32740

DETONATION

Transient ignition mechanisms of confined solid propellants under rapid pressurization
[AD-A088080] N80-32539

Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541

Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

Numerical solution of a nonsteady blast wave propagation in two-phase (separated flow) reactive medium
[TAE-398] N80-32686

PUFF TOD: A residual stress experiment --- underground explosions
[SAND-79-1674] N80-32788

DETONATION WAVES

The mechanism of a detonation wave enhancement in a two-phase combustible medium
[TAE-393] N80-32687

DEUTERIUM

Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01398-444] N80-33193

DEUTERIUM COMPOUNDS

Energy and technology review
[UCRL-52000-80-6] N80-32909

DEUTERIUM FLUORIDES

Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455

DIAGRAMS

The free-body diagram revisited
[AD-A087952] N80-33173

DIAMETERS

The diameter of almost all bipartite graphs
[AD-A087687] N80-33125

DICKE RADIOMETERS

Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32655

DIELECTRICS

A bounds on the resonant frequency of rectangular microstrip antennas
[NASA-TM-81882] N80-32609

Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669

DIESEL ENGINES

Ceramic coatings on diesel engine components
[DOE/ET-15320/T1] N80-32732

Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733

Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734

Potential of diesel engine, emission technology
[PB80-192685] N80-32735

DIESEL FUELS

Liquid fuels production from biomass --- corn and algae
[COO-4389-19] N80-32545

Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731

DIFFERENCE EQUATIONS

Functional difference equations and an epidemic model
[AD-A088108] N80-33135

DIFFERENTIAL EQUATIONS

Efficient algorithms for solving systems of ordinary differential equations for ecosystem modeling
[PB80-190986] N80-33002

Generic properties of an integro-differential equation
[AD-A088242] N80-33129

Identification of nonlinear delay systems using spline methods
[AD-A088251] N80-33134

A uniqueness theorem for ordinary differential equations
[AD-A088113] N80-33137

Rapid solution of finite element equations on locally refined grids by multi-level methods
[AD-A088085] N80-33139

Automatic multirate methods for ordinary differential equations
[COO-2383-0062] N80-33147

DIFFRACTION PATTERNS

Laser angle measurement system
[NASA-CR-159306] N80-32405

DIFFUSION

Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-580-VOL-45-NO-5] N80-33251

DIGITAL COMPUTERS

Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429

Thermal radiation analysis system TRASYS 2: User's manual
[NASA-CR-159273-1] N80-32690
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691

DIGITAL DATA
Seasat-A land applications data processing plan
[E80-10317] N80-32610
Using LANDSAT digital data for estimating green biomass — Throckmorton, Texas test site and Great Plans Corridor, US
[E80-10328] N80-32619
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840

DIGITAL FILTERS
A simplified digital filter design
[AD-A087772] N80-32658

DIGITAL SYSTEMS
Recording media archival attributes (magnetic)
[AD-A088187] N80-32704
On-line direct digital control extrusion process
[PB80-186489] N80-32738
Invertible binary matrices — techniques in digital network synthesis
[AD-A085575] N80-33128

DIGITAL TECHNIQUES
Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32655
Digital restoration of AC-coupled infrared images
[AD-A085430] N80-33213

DILUTION
Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-580-VOL-45-NO-5] N80-33251

DIODES
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Design, fabrication and evaluation of low cost diode oscillator for millimeter waves
[AD-A087954] N80-32667

DIPOLE ANTENNAS
Low sidelobe S-band line source array
[AD-A087651] N80-32616

DIPOLE MOMENTS
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444

DIRECT CURRENT
Open-cycle MHD power conditioning and control requirements definition
[EPRI-AP-1345] N80-32864

DIRECT POWER GENERATORS
Direct electrochemical generation of electricity from coal
[SAN-0115/105-1] N80-32865

DIRECTIONAL SOLIDIFICATION (CRYSTALS)
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32487

DISCOLORATION
Oxidative stabilization of acrylic fibers. Part 5: The decoloration reaction
[AD-A088299] N80-32523

DISCRETE ADDRESS BEACON SYSTEM
Discrete Address Beacon System (DABS) front end processor en route central computer complex protocol
[AD-A085482] N80-32367

DISPERSIONS
Performance of simple models for stack plume dispersion during convective conditions
[PB80-191869] N80-33001

DISPLACEMENT
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33282

DISPLAY DEVICES
Preliminary evaluation of time and distance spacing cues using a cockpit displayed target
[NASA-TM-81794] N80-32362
Electroluminescent display technology
[AD-A085641] N80-32663
High contrast electroluminescent readout device
[AD-A088237] N80-32673
High contrast electroluminescent numeric readout device
[AD-A088238] N80-32674
Automating the E-beam laser
[AD-A079529] N80-32709
Psychophysical criteria for visual simulation systems. Phase 2: Experimental investigations of display joints and scene inserts
[AD-A088316] N80-33091
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100
Computer-assisted chart making from the graphic designer's perspective
[LBL-10239] N80-33115

DISTRIBUTED PARAMETER SYSTEMS
Fault tolerant computer network study
[AD-A088066] N80-33118

DISTRIBUTION FUNCTIONS
The influence curve and goodness of fit
[AD-A085593] N80-33152
Nonparametric Bayes estimation of distribution functions and the study of probability density estimates
[AD-A088250] N80-33156
Likelihood ratio tests for and against a stochastic ordering between multinomial populations tests for a stochastic ordering
[AD-A088194] N80-33163

DIURNAL VARIATIONS
Comparison of changes in the ionospheric total electron content at mid-latitude locations few hundred kilometers apart
[INPE-1798-RPE/168] N80-33029
A climatological study of the tropospheric circulation over the Amazon region
[INPE-1761-RPE/150] N80-33050

DIVERTERS
A diverted plasma reversed field pinch
[AD-A088049] N80-33225

DOCUMENTATION
Universal documentation system handbook. Volume 3: Program support plan and operations directive
[AD-A088222] N80-32415

DOPED CRYSTALS
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254

DOPPLER EFFECT
Earth's rotation in 1975-1979 based on Doppler satellite observations
[AD-A088095] N80-32804

DOPPLER RADAR
Multibeam single frequency synthetic aperture radar processor for imaging separate range swaths
[NASA-CASE-NPO-14525-2] N80-32607
Windfield retrieval from Doppler lidar observations
[NASA-CR-161572] N80-33123

DOSIMETERS
Fusion materials high energy-neutron studies
[HEDL-SA-2145-FP] N80-33207

DRAG
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338

DRAG DEVICES
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351

DRAG REDUCTION
Improved low-drag ground vehicle particularly suited for use in safely transporting livestock
[NASA-CASE-FRC-11058-1] N80-33312

DRAINAGE
Pavement and geometric design criteria for minimizing hydroplaning. A technical summary
[PB80-190457] N80-32603

DRAINAGE PATTERNS
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843

DRILLING
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
Conventional machining of ESR 4340 steel
[AD-A088451] N80-32591

DROP SIZE
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-567] N80-32955

DROUGHT
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053

DUCTS
Apparatus for supplying conditioned air at a substantially constant temperature and humidity
[NASA-CASE-GSC-12191-1] N80-32583

DURABILITY
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527
Belt for transmitting power from a cogged driving member to a cogged driven member
[NASA-CASE-GSC-12289-1] N80-32717

DUST
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625

DUST COLLECTORS
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007

DYE LASERS
Two-photon excitation of nitric oxide fluorescence as a temperature indicator in unsteady gas-dynamic processes
[NASA-TM-81220] N80-32700

DYNAMIC CHARACTERISTICS
Dynamic modal estimation using instrumental variables
[NASA-CR-152396] N80-32777
Precision gravity studies at Cerro Prieto: The second year
[LBL-9551] N80-33044

DYNAMIC CONTROL
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725

DYNAMIC LOADS
A void growth failure criterion applied to dynamically and statically loaded thin rings
[AD-A088515] N80-32781

DYNAMIC RESPONSE
Materials response to ultra-high loading rates — with application to armor The state of understanding of the response of metals to ultrahigh loading rates is reviewed, with application to armor.
[NMAB-356] N80-32485
Theoretical studies of columns under axial impact and experimental verification
[TAE-377] N80-32749
Statistical energy analysis of complex structures, phase 2
[NASA-CR-161576] N80-32752

DYNAMIC STABILITY
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725

DYNAMIC STRUCTURAL ANALYSIS
Inelastic behavior of structural components
N80-32773

DYNAMIC TESTS
Dynamic mixed mode fracture — stress intensity factors
[AD-A088287] N80-32784

DYSON THEORY
Electron correlations in narrow bands
[INPE-1813-RPE/181] N80-33255

E

EARTH ATMOSPHERE
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970
EARTH RADIATION BUDGET EXPERIMENT
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32430
EARTH ROTATION
Earth's rotation in 1975-1979 based on Doppler satellite observations
[AD-A088095] N80-32804
EARTH SURFACE
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
EARTHQUAKES
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033
ECONOMIC ANALYSIS
Applications of advanced electric/electronic technology to conventional aircraft
[NASA-CR-163576] N80-32375
Comparison of solar-thermal and fossil total-energy systems for selected industrial applications
[ORNL/TM-7022] N80-32871
Chemical energy storage for solar thermal conversion
[SAND-79-8198] N80-32889
Economic evaluation of the Annual Cycle Energy System (ACES). Volume 1: Executive summary
[ORNL/SUB-7470/1-V1] N80-32905
Simple economic evaluation and applications experiments for photovoltaic systems for remote sites
[SAND-80-0749C] N80-32937
ECONOMIC DEVELOPMENT
Incentives for technological innovation in air pollution reduction: An ETIP policy research series. Volume 1: Emission offset policy at work. A summary analysis of 8 cases
[PB80-187610] N80-33022
The State Science, Engineering and Technology program in North Carolina, study phase
[PB80-190846] N80-33307
ECONOMIC FACTORS
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
Synthetic fuels from US oil shales: A technical and economic verification of the HYTORT process
[DOE/ET-14102-2] N80-32567
Use of solar energy to produce process heat for industry
[SERI/TP-731-626] N80-32863
Documentation of volume 3 of the 1978 Energy Information Administration annual report to congress
[DOE/EIA-CR-0456] N80-32869
Costing methodologies for energy systems
[BNL-27603] N80-32900
Potential for supplying solar thermal energy to industrial unit operations
[SERI/TP-632-584] N80-32911
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942
Economic impact of sulfur dioxide and particulate matter regulations in Illinois
[PB80-182645] N80-32992
ECOSYSTEMS
Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964
Ecosystem theory and the unexpected: Implications for environmental toxicology
[CONF-800376-1] N80-32975
Microcosms as potential screening tools for evaluating transport and effects of toxic substances
[ORNL/EPA-4] N80-32979
Modeling the role of terrestrial ecosystems in the global carbon cycle
[CONF-800549-3] N80-32981
Efficient algorithms for solving systems of ordinary differential equations for ecosystem modeling
[PB80-190986] N80-33002
EDGES
Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754
EDUCATION
Satellite Instructional Television Experiment. Television comes to village: An evaluation of SITE
[ISRO-SAC-TR-09-78] N80-32611
The free-body diagram revisited
[AD-A087952] N80-33173
EFFECTIVE PERCEIVED NOISE LEVELS
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184
EFFECTS
Scale size of the cosmic ray modulating region
[INPE-1826-RPE/192] N80-33331
EFFICIENCY
Environmental assessment. Energy efficiency standards for consumer products
[DOE/CS-0168] N80-32988
EFFLUENTS
Identification and quantification of hydrocarbon products in effluents
[AD-A088268] N80-32454
Sampling and analysis of reduced and oxidized species in process streams
[PB80-191281] N80-32994
Effective sampling techniques for particulate emissions from atypical stationary sources
[PB80-185549] N80-33010
Rock filters for removal of algae from lagoon effluents
[PB80-190077] N80-33016
EJECTION SEATS
Advanced restraint system modeling
[AD-A088029] N80-32357
ELASTIC BENDING
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140
ELASTIC DEFORMATION
Straightening of a wavy strip: An elastic-plastic contact problem including snap-through N80-32768
ELASTIC PROPERTIES
Post-buckling behavior of a beam-column on a nonlinear elastic foundation with a gap N80-32767
Finite element analysis of hyperelastic structures N80-32770
A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A088375] N80-32780
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209
ELASTIC WAVES
Elastic wave propagation through multilayered media
[AD-A088030] N80-32636
Matrix theory of elastic wave scattering: Application to scattering of transverse waves
[UCRL-84116] N80-32649
ELASTODYNAMICS
Finite elements for contact problems in two-dimensional elastodynamics N80-32772
ELASTOMERS
Curable liquid hydrocarbon prepolymers containing hydroxyl groups and process for producing same
[NASA-CASE-NPO-13137-1] N80-32514
Prepolymer dianhydrides
[NASA-CASE-NPO-13899-1] N80-32515
Synthesis and characterization of new silicone condensation polymers
[UCRL-84304] N80-32530
Development of procedures for calculating stiffness and damping of elastomers in engineering applications, part 7
[NASA-CR-165138] N80-32718
ELECTRIC AUTOMOBILES
Comparative analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-52933] N80-32907
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940
ELECTRIC BATTERIES
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940
Lithium batteries. Citations from the NTIS data base
[PB80-812399] N80-32967
Lithium batteries. Citations from the Engineering Index data base
[PB80-812407] N80-32968
Assessment of environmental control technologies for energy storage systems, 1979
[LA-8308-MS] N80-32973
ELECTRIC CONDUCTORS
Satellite spacecraft charging control materials
[AD-A087675] N80-32420
Chemical, spectral, structural, and charge transport properties of the molecular metals produced by ionization of nickel phtalocyanine
[AD-A087553] N80-32449
Electrically conductive macromolecules via cofacial assembly techniques
[AD-A087554] N80-32519
ELECTRIC CONNECTORS
Electrical self-aligning connector
[NASA-CASE-MFS-25211-1] N80-32651
ELECTRIC CONTACTS
A study of metal-semiconductor contacts on indium phosphide
[AD-A087666] N80-33256
ELECTRIC CORONA
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006
Charge Measurements of particles exiting electrostatic precipitators
[PB80-187438] N80-33011
ELECTRIC CURRENT
Approximate calculations of radiation-induced currents
[AD-A087893] N80-32614
Calculation of the Biot-Savart law magnetic field using current distributions obtained from a finite element analysis
[AD-A088094] N80-33172
Electronic process in InP and related compounds
[AD-A084260] N80-33261
ELECTRIC DISCHARGES
Thermally stimulated discharge current analysis of epoxy resins
[AD-A088213] N80-32526
Investigation of discharge processes in electrically excited blue/green lasers
[AD-A087682] N80-32710
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
ELECTRIC ENERGY STORAGE
Planning for electric utility solar applications: The effects on reliability and production cost estimates of the variability in demand
[SERI/TP-351-545] N80-32888
ELECTRIC FIELDS
Electro-optical measurements of solid insulator surface fields and surface charging in vacuum
[PB80-192875] N80-32685
Quantitative simulation of a magnetospheric storm. 3: Plasmaspheric electric fields and evolution of the plasmapause
[NASA-CR-163455] N80-33041
Preliminary study of the behavioral and biological effects of high intensity 60 Hz electric fields
[SWRI-14-5277] N80-33088
Ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198
ELECTRIC GENERATORS
Advanced coal gasification system for electric power generation
[FE-1514-113] N80-32557

Development of a 50 Hz, 250 kV, 500 ns, 500 KW average power pulse
[SAND-80-0491C] N80-32684
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868

ELECTRIC MOTOR VEHICLES
Aluminum air battery for electric vehicle propulsion
[UCRL-84443] N80-32941

ELECTRIC POTENTIAL
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755

ELECTRIC POWER PLANTS
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570
High-temperature turbine technology program. Overall Plant Design Description (OPDD) coal-derived liquid
[FE-1806-84] N80-32728
High-temperature turbine technology program. Overall Plant Design Description (OPDD) low-Btu coal gas electric power plant
[FE-1806-83] N80-32729
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Open-cycle MHD systems analysis
[EPRI-AP-1316] N80-32881
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32893
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972
Simulation of the energy-industry-environment system for limited economic regions, using the example of Baden-Wuerttemberg. Part 1: Data, model development adaptation
[IKE-K-54-20-PT-1] N80-32974
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987
Systems assessment of heavy ion beam fusion drivers
[DOE/DP-40039] N80-33247

ELECTRIC POWER SUPPLIES
Nickel cadmium batteries. Citations from the NTIS data base
[PB80-812340] N80-32966

ELECTRIC REACTORS
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678

ELECTRIC WIRE
A-15 superconducting composites in the 0.1 micron region --- casting alloys for magnet wire
[IS-M-274] N80-33274

ELECTRICAL ENGINEERING
Basic research in electronics, JSEP
[AD-A088121] N80-32672

ELECTRICAL IMPEDANCE
Admittance of an infinitely long monopole antenna immersed in a dissipative medium and driven by an airfilled coaxial line
[SAND-79-1401] N80-32648

ELECTRICAL MEASUREMENT
Apparatus for measuring semiconductor device resistance
[NASA-CASE-NPO-14424-1] N80-32650

ELECTRICAL RESISTANCE
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
Apparatus for measuring semiconductor device resistance
[NASA-CASE-NPO-14424-1] N80-32650
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088278] N80-32782
Plated-through hole testing
[BDX-613-2424] N80-32800

ELECTRICAL RESISTIVITY
Microwave properties of low density (CH) sub x
[AD-A086943] N80-32518
Electrical self-aligning connector
[NASA-CASE-MFS-25211-1] N80-32651
Semiconductor measurement technology
[AD-A088262] N80-32668
Power ratings of rf thin film resistive attenuators
[BDX-613-2404] N80-32683
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006
Percolation and electrical conduction in superconducting composites
[AD-A088196] N80-33271

ELECTRICITY
Direct electrochemical generation of electricity from coal
[SAN-0115/105-1] N80-32865

ELECTRO-OPTICS
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391
Electro-optical measurements of solid insulator surface fields and surface charging in vacuum
[PB80-192875] N80-32685
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275

ELECTROCARDIOGRAPHY
Pocket ECG electrode
[NASA-CASE-ARC-11258-1] N80-33081

ELECTROCATALYSTS
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878

ELECTROCHEMICAL CELLS
Direct electrochemical generation of electricity from coal
[SAN-0115/105-1] N80-32865
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Aluminum air battery for electric vehicle propulsion
[UCRL-84443] N80-32941
Lithium batteries. Citations from the NTIS data base
[PB80-812399] N80-32967

ELECTROCHEMISTRY
Interaction of radiation with matter.
[DOE/EV-02386/1] N80-32436

ELECTRODEPOSITION
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953

ELECTRODES
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Lithium batteries. Citations from the Engineering Index data base
[PB80-812407] N80-32968
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating --- coal combustion product environments
[NASA-TM-81555] N80-33221

ELECTRODYNAMICS
A collinear N-body problem of classical electrodynamics
[AD-A088114] N80-32456

ELECTROLUMINESCENCE
Electroluminescent display technology
[AD-A085641] N80-32663
High contrast electroluminescent readout device
[AD-A088237] N80-32673
High contrast electroluminescent numeric readout device
[AD-A088239] N80-32674

ELECTROLYSIS
Hydrogen production from remote power sites
[BNL-27457] N80-32553
Fusion reactors for hydrogen production via electrolysis
[BNL-27782] N80-32559
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878

ELECTROLYTES
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917

ELECTROMAGNETIC FIELDS
Electromagnetic fields induced by ocean currents
[AD-A085727] N80-32627
Computations of the radiation pattern of a reflector antenna
[AD-A088273] N80-32633

ELECTROMAGNETIC INTERACTIONS
Interaction of radiation with matter.
[DOE/EV-02386/1] N80-32436
Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171

ELECTROMAGNETIC MEASUREMENT
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334

ELECTROMAGNETIC NOISE
Noise suppression methods for robust speech processing
[AD-A085667] N80-32629
Experimental measurements of ambient electromagnetic noise from 1.0 to 4.0 kHz
[AD-A088090] N80-32638
Basic research in electronics, JSEP
[AD-A088121] N80-32672

ELECTROMAGNETIC PROPERTIES
Electromagnetic instabilities in collisionless plasmas
[UCRL-TRANS-11593] N80-33240

ELECTROMAGNETIC PULSES
A study of power and energy in the aurora modification project
[AD-A088051] N80-32637

ELECTROMAGNETIC RADIATION
Approximate calculations of radiation-induced currents
[AD-A087893] N80-32614
Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669

ELECTROMAGNETIC SCATTERING
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617
Statistical characterization of rough terrain
[AD-A087746] N80-32619
Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669

ELECTROMECHANICAL DEVICES
Environmental assessment. Energy efficiency standards for consumer products
[DOE/CS-0168] N80-32988

ELECTRON ACCELERATORS
Diocotron instability of a relativistic coaxial multi-ring hollow electron beam
[AD-A088054] N80-33197

ELECTRON BEAMS
Diocotron instability of a relativistic coaxial multi-ring hollow electron beam
[AD-A088054] N80-33197

ELECTRON BOMBARDMENT
Design, fabricate and test an Electron Bombarded Semiconductor (EBS) amplifier
[NASA-CR-160002] N80-32656
Circular scan streak tube development
[NASA-CR-160029] N80-33211

ELECTRON CAPTURE
Electron-temperature dependence of dissociative recombination of electrons with CO(+)-(CO)n-series ions
[NASA-CR-163572] N80-33187
ELECTRON CYCLOTRON HEATING
Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222
ELECTRON DENSITY (CONCENTRATION)
Interatomic forces in solid and liquid transition metals
[AD-A087872] N80-32492
Ionospheric F-region response to geomagnetic storms, over Brazilian low latitude
[INPE-1835-RPE/197] N80-33025
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
ELECTRON ENERGY
Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541
Electron-temperature dependence of dissociative recombination of electrons with CO(+)-(CO)n-series ions
[NASA-CR-163572] N80-33187
Three dimensional calculation of electron energy loss in a variable parameter free-electron laser
[BNL-27598] N80-33195
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227
ELECTRON IMPACT
Investigation of discharge processes in electrically excited blue/green lasers
[AD-A087682] N80-32710
ELECTRON MICROSCOPES
Application of analytical electron microscopy to the study of intergranular corrosion in 304 stainless steel
[BNL-27344] N80-32506
ELECTRON OPTICS
Circular scan streak tube development
[NASA-CR-160029] N80-33211
ELECTRON PARAMAGNETIC RESONANCE
Electron paramagnetic resonance spectroscopy of vanadium (IV) complexes and related species
[AD-A088311] N80-32458
ELECTRON PHOTON CASCADES
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33282
ELECTRON PLASMA
Survey of the plasma electron environment of Jupiter: A view from Voyager
[NASA-TM-80731] N80-33325
ELECTRON PRECIPITATION
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028
ELECTRON SCATTERING
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625
Initial study of ballistic effects for the operation of GaAs FET devices
[AD-A088350] N80-33270
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284
ELECTRON SPECTROSCOPY
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A088118] N80-32457
ELECTRON TRANSFER
Light induced electron transfer reactions of metal complexes
[BNL-28043] N80-33277
ELECTRON TRANSITIONS
Electron correlations in narrow bands
[INPE-1813-RPE/181] N80-33255
ELECTRON TUNNELING
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284
ELECTRON-ION RECOMBINATION
Electron-temperature dependence of dissociative recombination of electrons with CO(+)-(CO)n-series ions
[NASA-CR-163572] N80-33187
ELECTRONIC COUNTERMEASURES
A computer program to analyze spread-spectrum system performance
[AD-A084179] N80-32624
ELECTRONIC EQUIPMENT
Automatic test equipment
[AD-A088177] N80-32408
ELECTRONIC EQUIPMENT TESTS
Availability/operational readiness test subsystem cost tradeoffs
[AD-A088201] N80-32743
Manufacturing process applications team (MATeam)
[NASA-CR-161577] N80-33313
ELECTROPHOTOMETRY
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460
ELECTROPLATING
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
High solids coating system
[AD-A088225] N80-32525
ELECTROSTATIC BONDING
High solids coating system
[AD-A088225] N80-32525
ELECTROSTATIC CHARGE
Service test of two fuel conductivity additives
[AD-A088046] N80-32540
Charge Measurements of particles exiting electrostatic precipitators
[PB80-187438] N80-33011
ELECTROSTATIC GYROSCOPES
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245
ELECTROSTATIC PRECIPITATORS
High resistivity behavior of hot-side electrostatic precipitators
[PB80-193071] N80-33006
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007
Charge Measurements of particles exiting electrostatic precipitators
[PB80-187438] N80-33011
A mathematical model of electrostatic precipitation, revision 2
[PB80-190994] N80-33019
ELEMENTARY EXCITATIONS
Electron correlations in narrow bands
[INPE-1813-RPE/181] N80-33255
ELEVONS
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
ELLIPSES
As-built design specification for equiproabability ellipses representation of CLASSY clusters
[E80-10320] N80-32812
EMISSION
Development and evaluation of an emissions control decision aid
[AD-A087358] N80-32621
EMISSION SPECTRA
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223
EMITTANCE
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214
EMULSIONS
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2669-T4] N80-32543
ENERGY ABSORPTION
Optical and mechanical properties of infrared materials
[AD-A088120] N80-33216
ENERGY ABSORPTION FILMS
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914
ENERGY CONSERVATION
Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733
Thermal energy storage for building heating and cooling applications
[ORNL-TM-7319] N80-32879
Annual Cycle Energy System (ACES)
[ORNL/CON-42] N80-32880
Simulation model for assessing building energy-conservation policies
[BNL-27802] N80-32901
Energy conservation via heat transfer enhancement
[COO-4649-10] N80-32906
Appraisal of the M factor and the role of building thermal mass in energy conservation
[ORNL/CON-46] N80-32958
Basic Research in Engineering: Process and Systems Dynamics and Control. High Priority Research Needs Relevant to Energy
[FE-2468-65] N80-33167
Relevance of the second law of thermodynamics to energy conservation
[DOE/CS-40178/01-VOL-1] N80-33288
ENERGY CONSUMPTION
Documentation of volume 3 of the 1978 Energy Information Administration annual report to congress
[DOE/EIA-CR-0456] N80-32869
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 2: Technical results
[SAND-79-7018/2-VOL-2] N80-32870
Simulation model for assessing building energy-conservation policies
[BNL-27802] N80-32901
International energy indicators
[DOE/IA-0010] N80-32918
Appraisal of the M factor and the role of building thermal mass in energy conservation
[ORNL/CON-46] N80-32958
Development of an energy consumption and cost data base for fuel cell total energy systems and conventional building energy systems
[ORNL/CON-38] N80-32960
ENERGY CONVERSION
Hydrogen production from remote power sites
[BNL-27457] N80-32553
Flash pyrolysis and gasification of coal through laser heating
[LA-UR-80-1094] N80-32573
Coal liquefaction
[DOE/FE-0003/79-2] N80-32574
Biomass energy production. Citations from the International Aerospace Abstracts data base
[PB80-810607] N80-32578
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 2: Technical results
[SAND-79-7018/2-VOL-2] N80-32870
Solar ponds and their applications
[SERI/TP-733-617] N80-32947
Environmental assessment report: Wellman-Galusha low-Btu gasification systems
[PB80-190796] N80-32995
Wind characteristics program element
[PNL-3211] N80-33073
ENERGY CONVERSION EFFICIENCY
Excimer laser technology
[LA-UR-80-1427] N80-32715

Improving the efficiency of silicon solar cells containing chromium
[NASA-CASE-NPO-15179-1] N80-32850
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Relevance of the second law of thermodynamics to energy conservation
[DOE/CS-40178/01-VOL-1] N80-33288

ENERGY DISSIPATION
AC losses in type-2 superconductors
[IS-M-280] N80-32679
Three dimensional calculation of electron energy loss in a variable parameter free-electron laser
[BNL-27598] N80-33195
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243
Relevance of the second law of thermodynamics to energy conservation
[DOE/CS-40178/01-VOL-1] N80-33288

ENERGY DISTRIBUTION
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033

ENERGY LEVELS
Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01388-444] N80-33193

ENERGY POLICY
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547
First report to Congress on the use of alcohol in motor fuels
[DOE/CS-0165] N80-32548
Hydrogen production from remote power sites
[BNL-27457] N80-32553
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556
California's biomass and its energy potential
[LBL-10058] N80-32564
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572
Coal liquefaction
[DOE/FE-0003/79-2] N80-32574
Effects of energy-efficient ventilation rates on indoor air quality at an Ohio elementary school
[LBL-10223] N80-32595
UTRC 8 kW wind turbine tests
[RFP-3085] N80-32722
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
Energy. A continuing bibliography with indexes, issue 26, 1 April - 30 June 1980
[NASA-SP-7043(26)] N80-32849
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851
Large wind turbines: A utility option for the generation of electricity
[NASA-TM-81502] N80-32858
Open-cycle MHD power conditioning and control requirements definition
[EPRI-AP-1345] N80-32864
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Porous media experience applicable to field evaluation for compressed air energy storage
[PNL-3294] N80-32873
Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874
Advanced technology fuel cell program
[EPRI-EM-1328] N80-32877
Reference energy systems as applied to regional energy policy
[BNL-26987] N80-32883
Planning for electric utility solar applications: The effects on reliability and production cost estimates of the variability in demand
[SERI/TP-351-545] N80-32888
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32893
Costing methodologies for energy systems
[BNL-27603] N80-32900
Economic evaluation of the Annual Cycle Energy System (ACES). Volume 1: Executive summary
[ORNL/SUB-7470/1-V1] N80-32905
Energy and technology review
[UCRL-52000-80-6] N80-32909
Monitoring of the performance of a solar heated and cooled apartment building
[DSE-5235-T1] N80-32913
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32915
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917
International energy indicators
[DOE/IA-0010] N80-32918
CdSiAs2 thin films for solar cell applications
[DOE/ET-23007/1] N80-32919
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/4] N80-32920
Amorphous thin films for solar-cell applications
[DOE/ET-21074/4] N80-32921
Assessment of hydrogen compressor technology for energy storage and transmission systems
[ORO-5598-T1] N80-32922
Solar index generation and delivery
[DOE/ET-20090/3] N80-32929
Investigation of the impurity tolerance of semicrystalline silicon solar cells silicon impact program
[DOE/CH-00178-T2] N80-32934
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-80-1569C] N80-32936
Thermographic techniques applied to solar collector systems analysis
[SERI/TP-351-540] N80-32946
Solar ponds and their applications
[SERI/TP-733-617] N80-32947
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Concentrating photovoltaic for the Tropics
[DOE/CS-04270/1] N80-32954
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957
Appraisal of the M factor and the role of building thermal mass in energy conservation
[ORNL/CON-46] N80-32958
Assessment of environmental control technologies for energy storage systems, 1979
[LA-8308-MS] N80-32973
Environmental assessment. Energy efficiency standards for consumer products
[DOE/CS-0168] N80-32988
Environmental-control-technology activities of the Department of Energy in FY 1979
[DOE/EV-0084] N80-32989
Basic Research in Engineering: Process and Systems Dynamics and Control. High Priority Research Needs Relevant to Energy
[FE-2468-65] N80-33167
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating --- coal combustion product environments
[NASA-TM-81555] N80-33221

ENERGY REQUIREMENTS
Planning for electric utility solar applications: The effects on reliability and production cost estimates of the variability in demand
[SERI/TP-351-545] N80-32888

ENERGY SOURCES
Documentation of volume 3 of the 1978 Energy Information Administration annual report to congress
[DOE/EIA-CR-0456] N80-32869

ENERGY SPECTRA
Spectroscopy of compact extragalactic X-ray sources --- HEAO observations
[NASA-TM-82010] N80-33332

ENERGY STORAGE
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-8] N80-32554
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856
Energy storage as heat-of-fusion in containerized salts. Report on energy storage boiler tank
[AD-A087753] N80-32862
Porous media experience applicable to field evaluation for compressed air energy storage
[PNL-3294] N80-32873
Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874
Advanced technology fuel cell program
[EPRI-EM-1328] N80-32877
Chemical energy storage for solar thermal conversion
[SAND-79-8198] N80-32889
Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897
Research and development for inertial energy storage based on a flexible flywheel
[SAND-79-7097] N80-32898
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917
Assessment of hydrogen compressor technology for energy storage and transmission systems
[ORO-5598-T1] N80-32922
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-567] N80-32955
Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964
Lithium batteries. Citations from the Engineering Index data base
[PB80-812407] N80-32968
Assessment of environmental control technologies for energy storage systems, 1979

ENGINE DESIGN
The energy efficient engine project
[NASA-TM-81566] N80-32395
Upgraded automotive gas turbine engine design and development program, volume 2
[NASA-CR-159671] N80-32719
High temperature turbine technology program. Phase 2: Technology test and support studies
[FE-2291-44A] N80-32721
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
Potential of diesel engine, emission technology
[PB80-192685] N80-32735

ENGINE INLETS
Unsteady transonic flows in a two-dimensional diffuser
[AD-A088231] N80-32400

ENGINE NOISE
Multiple pure tone elimination strut assembly
[NASA-CASE-FRC-11062-1] N80-32393
Study of lateral excess sound attenuation as determined from far part 36 aircraft noise certification measurements
[AD-A088285] N80-33183
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184

ENGINE TESTS
Performance deterioration of commercial high-bypass ratio turbofan engines
[NASA-TM-81552-REV] N80-32394
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Ceramic coatings on diesel engine components
[DOE/ET-15320/T1] N80-32732

ENTROPY
Accelerated life tests and information
[AD-A088014] N80-32741

ENVIRONMENT EFFECTS
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645
A methodology for the environmental assessment of advanced coal extraction systems
[NASA-CR-163570] N80-32827
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-32846
Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964
The effect of designated pollutants on plant species
[AD-A078933] N80-32969
Ecosystem theory and the unexpected: Implications for environmental toxicology
[CONF-800376-1] N80-32975
Microcosms as potential screening tools for evaluating transport and effects of toxic substances
[ORNL/EPA-4] N80-32979
Environmental assessment report: Wellman-Galusha low-Btu gasification systems
[PB80-190796] N80-32995
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021
Evaluation of carbon monoxide in blood samples from the second national health and nutrition survey
[COO-4552-2] N80-33089

ENVIRONMENT MANAGEMENT
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963

ENVIRONMENT MODELS
Microcosms as potential screening tools for evaluating transport and effects of toxic substances
[ORNL/EPA-4] N80-32979
Modeling the role of terrestrial ecosystems in the global carbon cycle
[CONF-800549-3] N80-32981

ENVIRONMENT POLLUTION
Costing methodologies for energy systems
[BNL-27603] N80-32900

ENVIRONMENT PROTECTION
Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964
Performance tests of high speed ZRV oil skimmer
[AD-A088062] N80-32971
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977
Methodologies to conduct regulatory impact analysis of ambient air quality standards for carbon monoxide
[PB80-192461] N80-33005
Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018

ENVIRONMENT SIMULATORS
Improved test methods for determining lightning-induced voltages in aircraft
[NASA-CR-3329] N80-32379

ENVIRONMENTAL CONTROL
Assessment of environmental control technologies for energy storage systems, 1979
[LA-8308-MS] N80-32973
Environmental-control-technology activities of the Department of Energy in FY 1979
[DOE/EV-0084] N80-32989

ENVIRONMENTAL ENGINEERING
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316

ENVIRONMENTAL MONITORING
Effects of energy-efficient ventilation rates on indoor air quality at an Ohio elementary school
[LBL-10223] N80-32595
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
Environmental Measurements Laboratory
[EML-374] N80-32978
Sandia National Laboratories 1979 environmental monitoring report
[SAND-80-0342] N80-32982
Occupant-generated CO2 as an indicator of ventilation rate
[LBL-10496] N80-32984
Environmental data for sites in the National Solar data network
[SOLAR/0010-80/05] N80-32986
Inventory of emissions from non-automotive vehicular sources
[PB80-182942] N80-32990
Sampling and analysis of reduced and oxidized species in process streams
[PB80-191281] N80-32994
Sorption properties of sediments and energy-related pollutants
[PB80-189574] N80-32997

ENVIRONMENTAL QUALITY
Biological degradation of hydrazine
[AD-A084426] N80-32536

ENVIRONMENTAL SURVEYS
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 1: Basic EIS appendices
[AD-A088320] N80-32644

ENVIRONMENTAL TESTS
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527

EPHEMERIDES
Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317

EPIDEMIOLOGY
Evaluation of carbon monoxide in blood samples from the second national health and nutrition survey
[COO-4552-2] N80-33089
Functional difference equations and an epidemic model
[AD-A088108] N80-33135

EPITAXY
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257
Solid-phase epitaxial growth --- of Si single crystal films
[AD-A084175] N80-33258

EPOXY MATRIX COMPOSITE MATERIALS
Radiant panel tests on an epoxy/carbon fiber composite
[NASA-TM-81185] N80-32435

EPOXY RESINS
An analysis of interlaminar stress gradients and impact damage in graphite-epoxy laminates
[AD-A088317] N80-32446
Thermally stimulated discharge current analysis of epoxy resins
[AD-A088213] N80-32526

EQUATIONS OF MOTION
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329

EQUATORIAL ATMOSPHERE
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
Wave disturbances in the low latitude ionosphere and equatorial ionosphere plasma depletions
[INPE-1806-RPE/174] N80-33027
Some characteristics of spread F at magnetic equatorial station Fortaleza
[INPE-1758-RPE/147] N80-33030
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037

EQUIPMENT
Apparatus for supplying conditioned air at a substantially constant temperature and humidity
[NASA-CASE-GSC-12191-1] N80-32583

EQUIPMENT SPECIFICATIONS
Automatic test equipment
[AD-A088177] N80-32408
Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586
Silicon concentrator solar cell manufacturing development
[SAND-80-7018] N80-32886

EROSION
Study of erosion mechanisms of engineering ceramics, static fatigue of ceramics
[AD-A087959] N80-32521
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

Application of remote sensing to state and regional problems --- Mississippi
[E80-10336] N80-32826

ERROR ANALYSIS
Loran-based buoy position auditing systems: Analytical evaluation
[AD-A088266] N80-32369
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32480
Using the acoustoelastic effect to measure stress in plates
[UCRL-52914] N80-32799

ERROR DETECTION CODES
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109

ERRORS
Automatic multirate methods for ordinary differential equations
[COO-2383-0062] N80-33147

ERYTHROCYTES
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085

ESCHERICHIA
Repair and cell cycle response in cells exposed to environmental biohazards
[ORO-4568-26] N80-32912

ESTIMATING
Estimators for the truncated beta-binomial distribution
[CONF-800644-1] N80-33148

ESTUARIES
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

ETCHING
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585

ETHYL COMPOUNDS
Diethylcarbamoyl chloride - Measurements Research Branch, analytical method
[PB80-193378] N80-32480
Predicted performance of energetic plasticizer formulations
[AD-A087658] N80-32542

ETHYLENE
Analysis of liquid volume and liquid mass fractions at coexistence for pure fluids
[PB80-191133] N80-32481
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848

EUROPE
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

EUTECTIC ALLOYS
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32487

EVALUATION
System description for the Airborne-Omega Data Bank
[AD-A087606] N80-32373
Reference energy systems as applied to regional energy policy
[BNL-26987] N80-32883
Photovoltaic mechanisms in polycrystalline thin-film silicon solar cells
[DOE/ET-23108/2] N80-32923

EVAPOTRANSPIRATION
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824

EXCIMERS
Excimer laser technology
[LA-UR-80-1427] N80-32715

EXCITATION
The quantum dynamics of chemical reactions
[AD-A084243] N80-32450
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191

EXHAUST EMISSION
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972
Inventory of emissions from non-automotive vehicular sources
[PB80-182942] N80-32990
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187453] N80-33013
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021

EXHAUST GASES
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976
Methodologies to conduct regulatory impact analysis of ambient air quality standards for carbon monoxide
[PB80-192461] N80-33005
Regulated and unregulated exhaust emissions from malfunctioning non-catalyst and oxidation catalyst gasoline automobiles
[PB80-190473] N80-33017
Regulated and unregulated exhaust emissions from malfunctioning three-way catalyst gasoline automobiles
[PB80-190804] N80-33020

EXHAUST NOZZLES
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397

EXHAUST SYSTEMS
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012

EXOTHERMIC REACTIONS
Thermal conductivity of consolidated Al/Cu2O thermites
[MLM-2698] N80-32503

EXPERIMENTAL DESIGN
PUFF TOO: A residual stress experiment --- underground explosions
[SAND-79-1674] N80-32788
Design evolution and verification of the general-purpose heat source --- for spacecraft power systems
[DOE/ET-33021/T1] N80-32930
Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950
Ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198

EXPLOSIONS
Materials response to ultra-high loading rates --- with application to armor The state of understanding of the response of metals to ultrahigh loading rates is reviewed, with application to armor.
[NMAB-358] N80-32485
Explosive demolition of activated concrete
[CONF-800542-4] N80-32597
Supernova models and light curves
[UCRL-84578] N80-33323

EXPLOSIVES
Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541
Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551

EXTERNAL STORES
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32384

EXTRAGALACTIC RADIO SOURCES
Spectroscopy of compact extragalactic X-ray sources --- HEAO observations
[NASA-TM-82010] N80-33332
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334

EXTRAPOLATION
On measuring the conformity of a parameter set to a trend, with applications
[AD-A087946] N80-33133

EXTREME ULTRAVIOLET EXPLORER SATELLITE
Filter development for the extreme ultraviolet explorer
[NASA-CR-160039] N80-32418

EXTREMELY HIGH FREQUENCIES
Advanced communications satellites
[NASA-TM-81599] N80-32608
Multipath propagation over snow at millimeter wavelengths
[AD-A087747] N80-32618

EXTREMELY LOW RADIO FREQUENCIES
Experimental measurements of ambient electromagnetic noise from 1.0 to 4.0 kHz
[AD-A088090] N80-32636

F

F REGION
Ionospheric F-region response to geomagnetic storms, over Brazilian low latitude
[INPE-1835-RPE/197] N80-33025
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037

F 2 REGION
Some characteristics of spread F at magnetic equatorial station Fortaleza
[INPE-1758-RPE/147] N80-33030

F-8 AIRCRAFT
Improved test methods for determining lightning-induced voltages in aircraft
[NASA-CR-3329] N80-32379

FABRICATION
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/4] N80-32920
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
Investigation of the impurity tolerance of semicrystalline silicon solar cells silicon impact program
[DOE/CH-00178-T2] N80-32934
The 3X Compound Parabolic Concentrating (CPC) solar energy collector
[DOE/CS-04239/T1] N80-32944

Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276

FACTOR ANALYSIS
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099

FADING
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056

FAILURE
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572

FAILURE ANALYSIS
Fundamentals of corrosion fatigue behavior of metals and alloys
[AD-A088358] N80-32496
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600
Depriming of arterial heat pipes: An investigation of CTS thermal excursions
[NASA-CR-165153] N80-32688
Reliability considerations of electronics components for the deep underwater muon and neutrino detection system
[LBL-10546] N80-32744
Response of nonlinear panels to random loads
N80-32756
A void growth failure criterion applied to dynamically and statically loaded thin rings
[AD-A088515] N80-32781
Laminated, composite flywheel failure analysis
[UCRL-15164] N80-32908
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109
On the first passage time distribution for a class of Markov chains
[AD-A088111] N80-33159

FALLING SPHERES
Experimental studies of impulsive noise produced by spheres moving through water
[AD-A084419] N80-33179

FALLOUT
Sandia National Laboratories 1979 environmental monitoring report
[SAND-80-0342] N80-32982

FAR FIELDS
Diffraction of a Cassegrain antenna subreflector
[INPE-1827-RPE/193] N80-32613
A parabolic cylinder reflector system with low sidelobes: Experimental results
[AD-A088202] N80-32639

FARADAY EFFECT
Influence of ion motion in the inverse Faraday effect
[INPE-1764-RPE/153] N80-33189

FARMLANDS
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

FATIGUE (MATERIALS)
Effect of load history on fatigue life
[AD-A088439] N80-32445
Fundamentals of corrosion fatigue behavior of metals and alloys
[AD-A088358] N80-32496
Metal matrix composites. A bibliography with abstracts
[PB80-811912] N80-32513
Study of erosion mechanisms of engineering ceramics, static fatigue of ceramics
[AD-A087959] N80-32521
Analysis of reinforced concrete structures with occurrence of discrete cracks at arbitrary positions
N80-32757
In-reactor fatigue crack propagation
[HEDL-SA-1927] N80-32803

FATIGUE LIFE
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088278] N80-32782

FATIGUE TESTING MACHINES
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755

FATIGUE TESTS
Neutron irradiation effects on fatigue crack propagation in type 316 stainless steels at 649 deg C
[AD-A088052] N80-32493
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32802
In-reactor fatigue crack propagation
[HEDL-SA-1927] N80-32803
A minimum excursion-time control system
[AD-A087774] N80-33096

FEASIBILITY ANALYSIS
Costing methodologies for energy systems
[BNL-27603] N80-32900
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935

FEDERAL BUDGETS
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424
Environmental-control-technology activities of the Department of Energy in FY 1979
[DOE/EV-0064] N80-32989
FY 1981 budget press briefing
[NASA-TM-82195] N80-33308
Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-166] N80-33310
NASA authorization for fiscal year 1979, part 1
[GPO-25-603] N80-33311

FEED SYSTEMS
A study on various methods of supplying propellant to an orbit insertion rocket engine
[TRW/DSSG-36358.001] N80-32413

FEEDBACK CONTROL
Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32655
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725

FERMENTATION
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
Biotechnology for a renewable resources chemicals and fuels industry, biochemical engineering R and D
[SERI/TP-621-659] N80-32561
Liquid fuels production from biomass
[COO-4386-11] N80-32563
Biomass energy production. Citations from the International Aerospace Abstracts data base
[PB80-810807] N80-32578

FERRIMAGNETS
Self-consistent many body theory for standard basis operator Green's function: An application to anisotropic ferromagnets
[INPE-1824-RPE/190] N80-33170

FIBER COMPOSITES
Radiant panel tests on an epoxy/carbon fiber composite
[NASA-TM-81185] N80-32435
Metal matrix composites. A bibliography with abstracts
[PB80-811912] N80-32513

FIBER OPTICS
Applications of advanced electric/electronic technology to conventional aircraft
[NASA-CR-163576] N80-32375
European fiber optics. USAF laboratory experts visit
[AD-A088209] N80-33217
Design and implementation of a fiber-optic gamma-measurement system
[UCRL-84109] N80-33219
Fiber optic communication links
[SAND-80-1290C] N80-33220

FIBER REINFORCED COMPOSITES
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437
Research on graphite reinforced glass matrix composites
[NASA-CR-159312] N80-32440

FIBER STRENGTH
Laminated, composite flywheel failure analysis
[UCRL-15164] N80-32908

FIBERS
Research and development for inertial energy storage based on a flexible flywheel
[SAND-79-7097] N80-32898

FIELD COILS
Tokamak poloidal field systems
[LA-8375-PR] N80-33233

FIELD EFFECT TRANSISTORS
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859
Initial study of ballistic effects for the operation of GaAs FET devices
[AD-A088350] N80-33270

FIELD INTENSITY METERS
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182

FIELD OF VIEW
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652

FIELD STRENGTH
Preliminary study of the behavioral and biological effects of high intensity 60 Hz electric fields
[SWRI-14-5277] N80-33068

FIELD THEORY (ALGEBRA)
On the analogy between mathematical problems of non-linear filtering and quantum physics
[AD-A088077] N80-33286

FIELD THEORY (PHYSICS)
Coupled wave model for large magnet coils
[NASA-CR-3332] N80-32587

FIGHTER AIRCRAFT
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366
Conceptual study of modifying an existing fighter for V/STOL capability and combat maneuvering enhancement
[AD-A087657] N80-32380

FILTRATION
Multielement analysis of water through osmotic reduction and X-rays
[PB80-216690] N80-32482

FINANCIAL MANAGEMENT
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32828
Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-166] N80-33310

FINITE DIFFERENCE THEORY
Computational strategy for the solution of large strain nonlinear problems using the Wilkins explicit finite-difference approach N80-32763
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824

FINITE ELEMENT METHOD
Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754
Computational models for the nonlinear analysis of reinforced concrete plates N80-32758
Self-adaptive incremental Newton-Raphson algorithms N80-32764
Study of solution procedures for nonlinear structural equations N80-32765
Finite element analysis of hyperelastic structures
N80-32770

Finite elements for contact problems in two-dimensional elastodynamics N80-32772

Nonlinear finite element analysis: An alternative formulation N80-32774

Corotational velocity strain formulations for nonlinear analysis of beams and axisymmetric shells N80-32775

Microcomputer system for medium-sized and experimental finite element analysis N80-32776

A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A088375] N80-32780

Approximation of finite element nodal point stresses for nonlinear material models
[K/TS-3788] N80-32791

Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792

Finite element stress analysis of a compression mold
[BDX-613-2387] N80-32801

Rapid solution of finite element equations on locally refined grids by multi-level methods
[AD-A088065] N80-33139

Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171

Calculation of the Biot-Savart law magnetic field using current distributions obtained from a finite element analysis
[AD-A088094] N80-33172

A functional for finite element analysis of low intensity magnetic fields including permanent magnetization effects
[AD-A086230] N80-33174

FIRE CONTROL

Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366

FIRE DAMAGE

Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406

FIRE FIGHTING

Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586

FIRE PREVENTION

General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354

FIREPROOFING

Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406

FIRES

Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32617

FIRING (IGNITING)

Ignition of NOS 365 liquid propellant containing an air bubble under simulated vreech pressurization conditions
[AD-A085723] N80-32538

FLAME IONIZATION

Diethylcarbamoyl chloride - Measurements Research Branch, analytical method
[PB80-193378] N80-32480

FLAME SPECTROSCOPY

Comparison of coherent and spontaneous Raman combustion diagnostics
[SAND-80-8616] N80-32477

Investigation of CARS and laser-induced saturated fluorescence for practical combustion diagnosis
[PB80-190515] N80-32479

FLAT PLATES

Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914

FLEXIBILITY

Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600

FLEXIBLE BODIES

Development of flexible rotor balancing criteria
[NASA-CR-159506] N80-32720

FLIGHT CHARACTERISTICS

Flight performance of the TCV B-737 airplane at Montreal/Dorval International Airport, Montreal, Canada, using TRSB/MLS guidance
[NASA-TM-81865] N80-32361

Transonic pitch damping of a delta wing aircraft determined from flight measurements
[AD-A087771] N80-32381

Helicopter dynamic performance program. Volume 1: Engineer's manual
[AD-A088474] N80-32386

FLIGHT CONTROL

Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360

Handling qualities of large flexible aircraft
[NASA-CR-163593] N80-32402

FLIGHT CREWS

Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406

PROCRU: A model for analyzing crew procedures in approach to landing
[NASA-CR-152397] N80-33090

FLIGHT HAZARDS

Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

FLIGHT MECHANICS

Potential problems relative to TDRS/IUS tilt table elevation with failed VRCS
[NASA-TM-82201] N80-32411

User's guide for the Flight Design System (FDS)
[NASA-TM-82202] N80-32426

FLIGHT OPERATIONS

PROCRU: A model for analyzing crew procedures in approach to landing
[NASA-CR-152397] N80-33090

FLIGHT SAFETY

NASA aviation safety reporting system
[NASA-TM-81197] N80-32352

Aircraft crash survival design guide. Volume 4: Aircraft seats, restraints, litters, and padding
[AD-A088441] N80-32358

FLIGHT SIMULATION

Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382

FLOOD PREDICTIONS

Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058

FLOODS

Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32626

FLORIDA

Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32605

FLOW CHARACTERISTICS

Development of high temperature viscosity measurement technique
[SAND-80-0641] N80-32476

Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

FLOW DISTRIBUTION

Computation of three-dimensional supersonic viscous flows in internal corners
[AD-A085857] N80-32345

Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346

Thermographic techniques applied to solar collector systems analysis
[SERI/TP-351-540] N80-32946

Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950

FLOW MEASUREMENT

Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2689-T4] N80-32543

FLOW STABILITY

Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346

FLOW VISUALIZATION

Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332

FLOWMETERS

Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2689-T4] N80-32543

FLUID DYNAMICS

Characteristic parameters in combustion processes and their accessibility to current and future diagnostics
[DOE/ER-05773/2] N80-32478

FLUID FILTERS

Beta gauge instrumentation for the measurement of aerosol mass
[PB80-195175] N80-32706

FLUID FLOW

Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508

Numerical simulation of reactive flow in internal combustion engines
[LA-UR-80-1633] N80-32730

Fluid temperature control for parabolic trough solar collectors
[SAND-79-2006C] N80-32894

FLUID MECHANICS

One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334

FLUIDIZED BED PROCESSORS

Advanced coal gasification system for electric power generation
[FE-1514-113] N80-32557

Miniplant and bench studies of pressurized fluidized-bed coal combustion
[PB80-189121] N80-32999

FLUORESCENCE

Investigation of CARS and laser-induced saturated fluorescence for practical combustion diagnosis
[PB80-190515] N80-32479

Chemical reactions in turbulent mixing
[AD-A088529] N80-32694

Two-photon excitation of nitric oxide fluorescence as a temperature indicator in unsteady gas-dynamic processes
[NASA-TM-81220] N80-32700

FLUTTER

Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329

FLUX (RATE)

A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330

FLUX DENSITY

Interference filter photometry of periodic comet Ashbrook-Jackson
[NASA-CR-163581] N80-33318

FLUX PINNING

Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507

FLY BY WIRE CONTROL

Applications of advanced electric/electronic technology to conventional aircraft
[NASA-CR-163576] N80-32375

FLYWHEELS

Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874

Development of cellulose flywheel rotors
[SAND-79-7089] N80-32882

Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897

Research and development for inertial energy storage based on a flexible flywheel
[SAND-79-7087] N80-32898

Laminated, composite flywheel failure analysis
[UCRL-15164] N80-32908

Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910

FOILS (MATERIALS)

Filter development for the extreme ultraviolet explorer
[NASA-CR-160039] N80-32418

FOLIAGE
An analysis of foliage effects on long-range surveillance
[AD-A088163] N80-32943

FORBUSH DECREASES
Scale size of the cosmic ray modulating region
[INPE-1826-RPE/192] N80-33331

FORECASTING
Planning and execution of a photographic mission over a wheat producing region in Rio Grande do Sul, Brazil
[INPE-1793-RPE/166] N80-32833
Documentation of volume 3 of the 1978 Energy Information Administration annual report to congress
[DOE/EIA-CR-0456] N80-32969

FOREIGN POLICY
Symposium on International Standards Information and ISONET
[PB80-197321] N80-33304

FOREST MANAGEMENT
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32838

FORESTS
Evaluation of remote sensing techniques on selected forest sites in Florida — Fort Myers and Gainesville test sites
[E80-10296] N80-32805
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions — Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Application of remote sensing to state and regional problems — Mississippi
[E80-10338] N80-32826
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193861] N80-32845

FORGING
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32389
Isothermal roll forging of T55 compressor blades, phase 2
[AD-A088078] N80-32495

FORMATIONS
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-33848

FORMULAS (MATHEMATICS)
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32798

FORMULATIONS
Predicted performance of energetic plasticizer formulations
[AD-A087858] N80-32542

FORTRAN
FLUOMEG: A planar finite difference mesh generator for fluid flow problems with parallel boundaries
[ORNL/TM-7115] N80-32897
A mathematical model of electrostatic precipitation, revision 2
[PB80-190994] N80-33019
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087964] N80-33111
Methods to insure the standardization of FORTRAN software
[ORNL/CSD/TM-95] N80-33113

FOSSIL FUELS
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-18] N80-32470
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-14] N80-32475
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32869
Constraints on carbon dioxide production from fossil fuel use
[ORAU/IEA-80-9(M)] N80-32963

FOSSILS
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-33846

FOURIER ANALYSIS
Wave disturbances in the low latitude ionosphere and equatorial ionosphere plasma depletions
[INPE-1806-RPE/174] N80-33027

FOURIER TRANSFORMATION
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628

FRACTOGRAPHY
Fracture toughness testing of HDPE plastic pipe
[MIT-CE-R79-5] N80-32751
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32902

FRACTURE MECHANICS
Fracture testing of injection molded glass and carbon fiber reinforced thermoplastics
[MIT-CE-R79-4] N80-32439
The method of lines in three dimensional fracture mechanics
[NASA-TM-81593] N80-32753
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088279] N80-32782
Dynamic mixed mode fracture — stress intensity factors
[AD-A088287] N80-32784
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A088335] N80-32785
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792
Consistent stress-strain ductile fracture model as applied to two grades of beryllium
[SAND-79-2126] N80-32793
Technique for studying multiple fractures produced at intermediate loading rates
[UCRL-83663] N80-32797
Theory of time-dependent rupture in the Earth
[NASA-CR-163587] N80-33024
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140
Boundary integral equation method for fracture problems with mixed mode deformations
[ORNL/CSD-57] N80-33146

FRACTURE STRENGTH
High toughness-high strength iron alloy
[NASA-CASE-LEW-12542-3] N80-32464
Fracture toughness of brittle materials determined with chevron notch specimens
[NASA-TM-81607] N80-32466
Toughening of thermosetting polyimides
[NASA-CR-163594] N80-32517
Fracture toughness testing of HDPE plastic pipe
[MIT-CE-R79-5] N80-32751
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209

FRAGMENTS
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535

FRANCE
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) — France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

FREE CONVECTION
Numerical solutions for steady thermal convection from a concentrated source in a porous medium
[SAND-79-2214] N80-32968

FREE ELECTRON LASERS
Three dimensional calculation of electron energy loss in a variable parameter free-electron laser
[BNL-27398] N80-33195

FREE ELECTRONS
Charge Measurements of particles exiting electrostatic precipitators
[PB80-187438] N80-33011

FREE JETS
Ultra high resolution inverse Raman spectroscopy of methane in a CW free expansion jet
[SAND-80-1370C] N80-32466

FREE MOLECULAR FLOW
Ultra high resolution inverse Raman spectroscopy of methane in a CW free expansion jet
[SAND-80-1370C] N80-32466

FREE RADICALS
Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32588

FREQUENCY STANDARDS
GPS NAVSTAR-4 and NTS-2 long term frequency stability and time transfer analysis
[AD-A088092] N80-32370
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33389

FREQUENCY SYNTHESIZERS
S and Ku band frequency source development
[NASA-CR-160033] N80-32654

FRESNEL INTEGRALS
Analytic approaches to unstable resonators
[AD-A088379] N80-32664

FRICTION
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512

FROST
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

FROST DAMAGE
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32580

FRUITS
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

FRUSTUMS
Concerning the separated flow about an inflating parachute
[RAE-TRANS-3081] N80-32336

FUEL CELLS
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-8] N80-32554
Direct electrochemical generation of electricity from coal
[SAN-0115/105-1] N80-33985
Advanced technology fuel cell program
[EPRI-EM-1329] N80-33877
Development of an energy consumption and cost data base for fuel cell total energy systems and conventional building energy systems
[ORNL/CON-38] N80-32960
Assessment of environmental control technologies for energy storage systems, 1979
[LA-8308-MS] N80-32973

Heat transfer and static stability tests of the General Purpose Heat Source (GPHS) configurations at Mach 6.0
[AD-A086001] N80-33087

FUEL COMBUSTION
Pulse combustion technology for heating applications
[ANL/EES/TM-66] N80-32467
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731

FUEL CONSUMPTION
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152360] N80-32353
The energy efficient engine project
[NASA-TM-81566] N80-32355
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733
Potential of spark ignition engine, effect of vehicle design variables on top speed, performance, and fuel economy
[PB80-191836] N80-32736
Potential of spark ignition engine, 1979 summary source document
[PB80-191034] N80-32737

FUEL GASES
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2880-T4] N80-32543

FUEL INJECTION
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396

FUEL PUMPS
A study on various methods of supplying propellant to an orbit insertion rocket engine
[TRW/DSSG-36008.001] N80-32413

FUEL SYSTEMS
Service test of two fuel conductivity additives
[AD-A086046] N80-32540
Potential of diesel engine, 1979 summary source document
[PB80-190669] N80-32734
Potential of diesel engine, emission technology
[PB80-152985] N80-32735
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187403] N80-33013

FUEL TANK PRESSURIZATION
Integral aircraft fuel tank leak classification
[AD-A086198] N80-32388
Transient ignition mechanisms of confined solid propellants under rapid pressurization
[AD-A086090] N80-32539

FUEL TANKS
Integral aircraft fuel tank leak classification
[AD-A086198] N80-32388

FUEL TESTS
Service test of two fuel conductivity additives
[AD-A086046] N80-32540
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2880-T4] N80-32543
Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018

FUEL-AIR RATIO
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396

FUNCTIONALS
Evaluation of computing systems using functionals of a Stochastic process
[NASA-CR-163512] N80-32102

FUNCTIONS (MATHEMATICS)
Nonanalytic function generation routines for 16-bit microprocessors
[NASA-TM-81586] N80-33104
Compiling fast partial derivatives of functions given by algorithms
[COO-2383-0063] N80-33145

FUSES (ORDNANCE)
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087789] N80-32344

FUSION REACTORS
Fusion reactors for hydrogen production via electrolysis
[BNL-27792] N80-32559
Fusion: An energy source for synthetic fuels
[BNL-27591] N80-33205
Fusion reactor blanket/shield design study
[ANL/FPP-79-1] N80-33242
Reversed-field pinch fusion reactor
[LA-UR-80-1494] N80-33246
Systems assessment of heavy ion beam fusion drivers
[DOE/DP-40039] N80-33247

G

GALACTIC NUCLEI
Spectroscopy of compact extragalactic X-ray sources — HEAO observations
[NASA-TM-82010] N80-33332

GALACTIC RADIATION
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1903-RPE/213] N80-33322

GALILEAN SATELLITES
Coordinates of features on the Galilean satellites
[NASA-CR-163582] N80-33326

GALLIUM ARSENIDES
Present and future trends in signal processing technologies
[AD-A086085] N80-32634
Design, fabrication and evaluation of low cost diode oscillator for millimeter waves
[AD-A087954] N80-32667
A monolithic GaAs IF amplifier for integrated receiver applications
[AD-A086098] N80-32670
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3329] N80-32859
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-80-1566C] N80-32936
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-79-2270C] N80-32938
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1782-RPE/151] N80-33253
Initial study of ballistic effects for the operation of GaAs FET devices
[AD-A086350] N80-33270

GAME THEORY
Optimal strategies for second guessers
[AD-A087697] N80-33124

GAMMA RAY ASTRONOMY
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1903-RPE/213] N80-33322

GAMMA RAY TELESCOPES
Total gamma absorption telescope with multiparametric analysis
[INPE-1904-RPE/172] N80-33321

GAMMA RAYS
Design and implementation of a fiber-optic gamma-measurement system
[UCRL-84199] N80-33219
A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330

GARMENTS
The development of an elastic reverse gradient garment to be used as a countermeasure for cardiovascular deconditioning
[NASA-CR-152379] N80-33066

GAS ANALYSIS
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Use of an automated mass spectrometer for an underground coal gasification field test
[UCRL-84366] N80-32565

GAS CHROMATOGRAPHY
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Diethylcarbamoyl chloride - Measurements Research Branch, analytical method
[PB80-193378] N80-32480
Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187368] N80-32577

GAS COOLING
Modeling and control of transonic cryogenic wind tunnels
[NASA-CR-163588] N80-32403
Magnetic refrigeration for space applications
[LA-UR-80-1566] N80-32596
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678

GAS IONIZATION
Hydrogen hollow cathode ion source
[NASA-CASE-LEW-12940-1] N80-33186
Photoionization of atoms
[COO-2892-18] N80-33192

GAS PRESSURE
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396

GAS SPECTROSCOPY
Applications of high resolution inverse Raman spectroscopy
[SAND-80-0639C] N80-32465

GAS STREAMS
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
Effective sampling techniques for particulate emissions from atypical stationary sources
[PB80-185549] N80-33010

GAS TEMPERATURE
Dynamic technique for launching stratospheric balloons with experiments weighing more than 500 Kg aboard
[INPE-1821-RPE/187] N80-32340

GAS TURBINE ENGINES
Parameter monitoring for corrosion control of utility gas turbines
[EPRI-AP-1369] N80-32504
Upgraded automotive gas turbine engine design and development program, volume 2
[NASA-CR-159671] N80-32719

GAS TURBINES
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32399
Parameter monitoring for corrosion control of utility gas turbines
[EPRI-AP-1369] N80-32504
High temperature turbine technology program. Phase 2: Technology test and support studies
[FE-2291-44A] N80-32721
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32893

GASES
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214

GASIFICATION
Biomass energy production. Citations from the International Aerospace Abstracts data base
[PB80-810807] N80-32578
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

GASOHOL (FUEL)
First report to Congress on the use of alcohol in motor fuels
[DOE/CS-0165] N80-32548
Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018

GASOLINE
First report to Congress on the use of alcohol in motor fuels
[DOE/CS-0165] N80-32548
Modifications for use of methanol or methanol-gasoline blends in automotive vehicles
[ALO-3682-T1] N80-32552
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012
Regulated and unregulated exhaust emissions from malfunctioning non-catalyst and oxidation catalyst gasoline automobiles
[PB80-190473] N80-33017
Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018
Regulated and unregulated exhaust emissions from malfunctioning three-way catalyst gasoline automobiles
[PB80-190804] N80-33020

GATES (CIRCUITS)
Integrated circuit design of a video reconstructor for a range-gated moving target indicator
[AD-A084376] N80-32661
Integrated optical logic gates. A demonstration of four optical logic functions
[AD-A087999] N80-33215

GAUSS EQUATION
Some Bayes estimators of reliability for the inverse Gaussian lifetime model
[AD-A088078] N80-33158

GEAR TEETH
Belt for transmitting power from a cogged driving member to a cogged driven member
[NASA-CASE-GSC-12289-1] N80-32717

GENERAL AVIATION AIRCRAFT
General aviation activity and avionics survey, 1978
[AD-A087653] N80-32325
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335
General aviation accidents: Postcrash fires and how to prevent or control them
[NTSB-AAS-80-2] N80-32354

GEOBOTANY
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions — Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

GEOCHEMISTRY
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32831
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834

GEODESY
Horizontal datums for nautical charts
[AD-A088340] N80-32839
Potential coefficient and anomaly degree variance modelling revisited
[AD-A082322] N80-33023

GEOLOGICAL SURVEYS
Paleontological resources evaluation: Red Fleet Reservoir
[PB80-204258] N80-32847

GEOMAGNETISM
Comparison of changes in the ionospheric total electron content at mid-latitude locations few hundred kilometers apart
[INPE-1798-RPE/168] N80-33029
Ion production in the D-region — through cosmic rays during solar flares and geomagnetic storms
[AD-A085533] N80-33038
Geomagnetic index calculation and use at AFGWC
[AD-A088234] N80-33043

GEOMETRY
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32336

GEOS 3 SATELLITE
An atlas of 1977 and 1978 GEOS-3 radar altimeter data for tropical cyclone studies
[NASA-TM-73288] N80-33046

GEOTHERMAL ENERGY CONVERSION
Heat pumps in low temperature applications
[CONF-800806-7] N80-32699
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-567] N80-32955

GEOTHERMAL RESOURCES
Remote sensing applied to the prospecting of geothermal anomaly in Caldas Novas County, State of Goias, Brazil
[INPE-1792-RPE/164] N80-32837

GEOTHERMAL TECHNOLOGY
Proceedings of the Ocean Energy Information Dissemination Workshop
[SERI/TP-732-600] N80-32956

GERMANY
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) — France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

GIMBALS
Research and development for inertial energy storage based on a flexible flywheel
[SAND-79-7097] N80-32898

GLASS
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505
Glasses and glass ceramics for sealing to aluminum alloys
[SAND-79-1405C] N80-32528
Nuclear waste management
[PNL-3000-4] N80-33203

GLASS FIBER REINFORCED PLASTICS
Fracture testing of injection molded glass and carbon fiber reinforced thermoplastics
[MIT-CE-R79-4] N80-32438

GLOBAL AIR SAMPLING PROGRAM
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970

GLOBAL POSITIONING SYSTEM
GPS NAVSTAR-4 and NTS-2 long term frequency stability and time transfer analysis
[AD-A088092] N80-32370
Alternate waveforms for a low-cost civil global positioning system receiver
[AD-A088345] N80-32371

GLYCOLS
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508

GNOTOBIOTICS
Advanced microbial check valve development
[NASA-CR-163577] N80-33094

GOES SATELLITES
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064

GONIOMETERS
Automated X-ray orientation for quartz crystal resonators
[AD-A088063] N80-33272

GOVERNMENT/INDUSTRY RELATIONS
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32828
Incentives for technological innovation in air pollution reduction: An ETIP policy research series. Volume 1: Emission offset policy at work. A summary analysis of 8 cases
[PB80-187610] N80-33022

GOVERNMENTS
Developing science and technology resources for the Governor, of the Ohio Science, Engineering and Technology Program for executive agencies
[PB80-190101] N80-33300
The Science, Engineering, and Technology Program for the New Jersey Executive Branch
[PB80-190242] N80-33301

GRADIENTS
Precision gravity studies at Cerro Prieto: The second year
[LBL-9551] N80-33044

GRAIN BOUNDARIES
Long-time creep behavior of the tantalum alloy Astar 811C — as a function of stress, temperature, and grain size
[NASA-TP-1691] N80-32489
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
High angle grain boundaries as sources or sinks for point defects
[DOE/ER-05002/8] N80-33279
Study of grain boundary segregation using the Auger electron emission technique
[DOE/ER-02166] N80-33280

GRAINS (FOOD)
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

GRAND CANYON (AZ)
Applied Remote Sensing Program (ARSP) — Arizona
[E80-10330] N80-32821

GRAPH THEORY
The diameter of almost all bipartite graphs
[AD-A087687] N80-33125

GRAPHIC ARTS
Computer-assisted chart making from the graphic designer's perspective
[LBL-10239] N80-33115

GRAPHITE
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
Research on graphite reinforced glass matrix composites
[NASA-CR-159312] N80-32440
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933

GRAPHITE-EPOXY COMPOSITE MATERIALS
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437
Effect of load history on fatigue life
[AD-A088439] N80-32445

GRASSES
Production of sugarcane and tropical grasses as a renewable energy source
[DOE-ET-20071/T1] N80-32546

GRASSLANDS
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Using LANDSAT digital data for estimating green biomass — Throckmorton, Texas test site and Great Plans Corridor, US
[E80-10328] N80-32819
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32836

GRAVITATION
Precision gravity studies at Cerro Prieto: The second year
[LBL-9551] N80-33044

GRAVITATIONAL FIELDS
Potential coefficient and anomaly degree variance modelling revisited
[AD-A082322] N80-33023
GRAVITY ANOMALIES
Potential coefficient and anomaly degree variance modelling revisited
[AD-A082322] N80-33023
GRAVITY WAVES
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040
GRAZING
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
GREAT LAKES (NORTH AMERICA)
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
Phosphorous control strategies at municipal wastewater treatment plants in the US Great Lakes Basin
[PB80-191059] N80-32998
GREAT PLAINS CORRIDOR (NORTH AMERICA)
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plains Corridor, US
[E80-10328] N80-32819
GREEN FUNCTION
On the theory of flow of regular water wave about a body
[AD-A084359] N80-32693
Self-consistent many body theory for standard basis operator Green's function: An application to anisotropic ferromagnets
[INPE-1824-RPE/190] N80-33170
Electron correlations in narrow bands
[INPE-1813-RPE/181] N80-33255
GREEN WAVE EFFECT
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plains Corridor, US
[E80-10328] N80-32819
GRINDING (MATERIAL REMOVAL)
Conventional machining of ESR 4340 steel
[AD-A088451] N80-32591
GROUND EFFECT (AERODYNAMICS)
Investigation of transient induced aerodynamics in a moving deck environment
[AD-A088164] N80-32350
GROUND EFFECT MACHINES
Air cushion craft development, first revision
[AD-A084740] N80-32592
GROUND STATIONS
Collection, processing, and distribution of remote sensing data from Brazilian Receiving Station
[INPE-1784-RPE/156] N80-32632
GROUND TESTS
Improved test methods for determining lightning-induced voltages in aircraft
[NASA-CR-3329] N80-32379
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425
GROUND TRUTH
As-built design specification for a list processing system
[E80-10325] N80-32816
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
GROUND WATER
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Preliminary estimate of regional effective ground-water recharge rates, related stream flow and water quality in Ohio
[PB80-193535] N80-32842
GROUND-AIR-GROUND COMMUNICATIONS
Discrete Address Beacon System (DABS) front end processor en route central computer complex protocol
[AD-A085482] N80-32367
GROUP THEORY
Supralgebras, supergroups and geometric gauging
[ORO-3992-384] N80-33169
GUATEMALA
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
GUN PROPELLANTS
Ignition of NOS 365 liquid propellant containing an air bubble under simulated vreech pressurization iconditions
[AD-A085723] N80-32538
GUNS (ORDNANCE)
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
GUSTS
Definition of gust model concept and review of gust models
[PNL-3138] N80-33072

H

HABITATS
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
HALOGENS
Vibrational frequencies of halogen atoms adsorbed on silver metal surfaces
[AD-A087664] N80-32491
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191
HANDBOOKS
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184
HANKEL FUNCTIONS
Analytic approaches to unstable resonators
[AD-A088378] N80-32664
HARDNESS TESTS
Weld overlaying for corrosion resistance in coal gasification atmospheres
[FE-2621-13] N80-32726
HARDWARE
Cardiopulmonary data acquisition system. Version 2.0, volume 1: User's guide
[NASA-CR-160608] N80-33083
HARMONIC ANALYSIS
Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222
HARNESSES
Aircraft crash survival design guide. Volume 4: Aircraft seats, restraints, litters, and padding
[AD-A088441] N80-32358
HEAO
Spectroscopy of compact extragalactic X-ray sources --- HEAO observations
[NASA-TM-82010] N80-33332
HEARING
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101
HEART RATE
A microprocessor-based cardiotachometer
[NASA-CR-160607] N80-33082
HEAT BALANCE
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32480
HEAT BUDGET
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
HEAT CAPACITY MAPPING MISSION
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
HEAT FLUX
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
Energy conservation via heat transfer enhancement
[COO-4649-10] N80-32906
HEAT OF FORMATION
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470
Predicted performance of energetic plasticizer formulations
[AD-A087658] N80-32542
HEAT OF FUSION
Energy storage as heat-of-fusion in containerized salts. Report on energy storage boiler tank
[AD-A087753] N80-32862
HEAT PIPES
Depriming of arterial heat pipes: An investigation of CTS thermal excursions
[NASA-CR-165153] N80-32888
Analysis of a passive heat pipe cooled solar photovoltaic receiver
[SAND-80-7011] N80-32885
HEAT PUMPS
Heat pumps in low temperature applications
[CONF-800806-7] N80-32869
Annual Cycle Energy System (ACES)
[ORNL/CON-42] N80-32880
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
Economic evaluation of the Annual Cycle Energy System (ACES). Volume 1: Executive summary
[ORNL/SUB-7470/1-V1] N80-32905
Feasibility study on a solar house heating system with a low quality thermal flow
[EUR-6696-EN] N80-32939
Self controlling, self pumping heat circulation system study
[COO-4484-07] N80-32952
HEAT RESISTANT ALLOYS
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32399
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32467

Dip process thermal barrier coatings for superalloys
[AD-A088064] N80-32494

HEAT SHIELDING
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32301
Thermal characteristics of Discharge-heated Copper Vapor Laser (DHCVL) heat shields formed of multiple coaxial cylinders
[UCRL-83649] N80-32714

HEAT SOURCES
Design evolution and verification of the general-purpose heat source — for spacecraft power systems
[DOE/ET-33021/T1] N80-32900

HEAT STORAGE
Design and operation of thermal convection loops for corrosion testing in molten NaNO3-KNO3 — solar-thermal conversion
[SAND-80-8212] N80-32501
Thermal energy storage for building heating and cooling applications
[ORNL-TM-7319] N80-32879
Annual Cycle Energy System (ACES)
[ORNL/CON-42] N80-32880
Seasonal thermal energy storage
[PNL-3322] N80-32899
Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950
Self controlling, self pumping heat circulation system study
[COO-4484-07] N80-32952
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-567] N80-32965

HEAT TRANSFER
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-9] N80-32554
Energy storage as heat-of-fusion in containerized salts. Report on energy storage boiler tank
[AD-A087753] N80-32862
Fluid temperature control for parabolic trough solar collectors
[SAND-79-3006C] N80-32894
Energy conservation via heat transfer enhancement
[COO-4649-10] N80-32906
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/80] N80-32914
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-567] N80-32955
Solar passive systems for buildings
[PB80-187719] N80-32962
New concept for a high-power beam dump
[UCRL-83696] N80-33208
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33228

HEAT TRANSMISSION
Self controlling, self pumping heat circulation system study
[COO-4484-07] N80-32952

HEAT TREATMENT
Hydrogen exchange in some coal-related reactions at 400 C
[CONF-800610-7] N80-32463
Dip process thermal barrier coatings for superalloys
[AD-A088064] N80-32494
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497

HEATING
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467

HEATING EQUIPMENT
Engineering test facility conceptual design — for magnetohydrodynamic generators
[DOE/FE-2614/3] N80-32943

HEAVING
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594

HEAVY IONS
Heavy ion beams for inertial fusion
[SLAC-PUB-2524] N80-33200
Inertial confinement fusion systems using heavy ion accelerators as drivers
[SLAC-PUB-2490] N80-33201
Systems assessment of heavy ion beam fusion drivers
[DOE/DP-40039] N80-33247

HELICOPTER DESIGN
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32384

HELICOPTER PERFORMANCE
Advanced structures concepts r and m/cost assessments — helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374
Helicopter dynamic performance program. Volume 1: Engineer's manual
[AD-A088474] N80-32386

HELICOPTERS
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90 — conducted in Langley 6 by 28 inch transonic tunnel
[NASA-TP-1701] N80-32333
Helicopter dynamic performance program. Volume 2: User's manual
[AD-A088318] N80-32387
OH-58C helicopter mast mounted sight/designator safety statement
[AD-A087673] N80-32390
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391

HELIUM
Thermodynamic properties of solid helium using an anharmonic anisotropic continuum model
[DOE/ER-01198/1314] N80-32598
Advanced concepts in closed-cycle lasers
[AD-A088226] N80-32712

HELIUM ISOTOPES
Use of helium-3 as a gas tracer for meso-scale meteorological studies
[DP-MS-79-51] N80-33070

HELIUM-NEON LASERS
Electronic processes in InP and related compounds
[AD-A088446] N80-33363

HELMETS
Weathering tests on protective helmets approved to Australian standard AS 1698, for vehicle users
[AD-A084232] N80-32740
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

HEMOGLOBIN
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085

HEURISTIC METHODS
Knowledge acquisition, knowledge programming, and knowledge refinement
[RAND/R-2540-NSF] N80-33128

HIGH ALTITUDE BALLOONS
Dynamic technique for launching stratospheric balloons with experiments weighing more than 500 Kg aboard
[INPE-1821-RPE/187] N80-32340

HIGH ASPECT RATIO
Large aspect ratio Tokamak study
[ORNL/TM-7278] N80-33239

HIGH ENERGY INTERACTIONS
Recent developments in nuclear reaction theories and calculations
[UCRL-81369] N80-33202

HIGH FREQUENCIES
Statistical energy analysis of complex structures, phase 2
[NASA-CR-161576] N80-32752

HIGH POWER LASERS
Excimer laser technology
[LA-UR-80-1427] N80-32715

HIGH RESOLUTION
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32430
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A086118] N80-32457
Advanced very high resolution radiometer, Mod 2 engineering report
[NASA-CR-160034] N80-32701
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193881] N80-32845
High resolution infrared radiation sounder/mod 2 (HIRS/2)
[NASA-CR-160030] N80-33055

HIGH SPEED
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087730] N80-32535

HIGH STRENGTH
A review and analysis of fiber counting methods
[AD-A088240] N80-32448

HIGH STRENGTH ALLOYS
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32399
High toughness-high strength iron alloy
[NASA-CASE-LEW-12542-3] N80-32484

HIGH STRENGTH STEELS
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
Conventional machining of ESR 4340 steel
[AD-A088451] N80-32591

HIGH TEMPERATURE AIR
Engineering test facility conceptual design — for magnetohydrodynamic generators
[DOE/FE-2614/3] N80-32943

HIGH TEMPERATURE ENVIRONMENTS
High temperature turbine technology program. Phase 2: Technology test and support studies
[FE-2291-44A] N80-32721
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating — coal combustion product environments
[NASA-TM-81565] N80-33221

HIGH TEMPERATURE PLASMAS
Nonlinear ion-cyclotron waves in mirror machines
[UCRL-83517] N80-33236

HIGH TEMPERATURE RESEARCH
Development of high temperature viscosity measurement technique
[SAND-80-0641] N80-32476

HIGH TEMPERATURE TESTS
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488

HIGHWAYS
The effect of compacted prestress on compacted lifiee compressibility
[PB80-191159] N80-32602

HILBERT SPACE
Iterative methods based upon residual averaging
N80-32762
The Riccati integral equation arising in optimal control of delay differential equations
[AD-A088097] N80-33122

HIMALAYAS
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions — Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

HOLDERS
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585

HOLES (ELECTRON DEFICIENCIES)
Semiconductor measurement technology
[AD-A088262] N80-32668

Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026

Semiconductor technology program, program briefs
[NASA-CR-163592] N80-33285

HOLLOW CATHODES
Hydrogen hollow cathode ion source
[NASA-CASE-LEW-12940-1] N80-33186

HOLOGRAPHIC INTERFEROMETRY
Weld evaluation on spherical pressure vessels using holographic interferometry
[UCRL-84079] N80-32745

Holographic and acoustic emission of evaluation of pressure vessels
[UCRL-84046] N80-32746

HOLOGRAPHY
Flaw detection and evaluation of composite cylinders using laser speckle interferometry and holography
[AD-A088206] N80-32447

Holographic and acoustic emission of evaluation of pressure vessels
[UCRL-84046] N80-32746

HOMING
Guidance and control of tactical missiles
[AD-A085147] N80-32422

HOMOMORPHISMS
A zero-one law for a class of measures on groups
[AD-A088374] N80-33130

Supralgebras, supergroups and geometric gauging
[ORO-3992-384] N80-33169

HOMOPOLAR GENERATORS
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856

HORSEPOWER
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723

HOT CORROSION
Parameter monitoring for corrosion control of utility gas turbines
[EPRI-AP-1369] N80-32504

HOT PRESSING
Analytical modeling of the hot isostatic pressing process
[AD-A088208] N80-32593

HUBS
Development of cellulose flywheel rotors
[SAND-79-7099] N80-32882

HUDSON RIVER (NY)
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

HUMAN FACTORS ENGINEERING
Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586

Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

Computer-assisted chart making from the graphic designer's perspective
[LBL-10239] N80-33115

HUMAN PERFORMANCE
Human performance in continuous operations. Volume 3: Technical documentation
[AD-A088339] N80-33092

HUMAN REACTIONS
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099

HUMIDITY
Apparatus for supplying conditioned air at a substantially constant temperature and humidity
[NASA-CASE-GSC-12191-1] N80-32583

Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824

Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057

The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066

HURRICANES
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826

HYDRAZINES
Biological degradation of hydrazine
[AD-A084426] N80-32536

Development of analytical techniques for toxicokinetic research
[AD-A077729] N80-33080

HYDROCARBON COMBUSTION
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470

HYDROCARBON FUEL PRODUCTION
Liquid fuels production from biomass --- corn and algae
[COO-4388-10] N80-32545

Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547

HYDROCARBON FUELS
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471

Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472

Study of methane fuel for subsonic transport aircraft
[NASA-CR-159320] N80-32533

Liquid fuels production from biomass
[COO-4388-11] N80-32563

Alcohol fuels. Citations from the NTIS data base
[PB80-812431] N80-32580

Alcohol fuels. Citations from the Engineering Index data base
[PB80-812449] N80-32581

Alcohol fuels. Citations from the Engineering Index data base
[PB80-812456] N80-32582

Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731

Catalyst effectiveness of high mileage in use vehicles
[PB80-192776] N80-33008

HYDROCARBONS
Identification and quantification of hydrocarbon products in effluents
[AD-A088268] N80-32454

Composition and temperature dependence of shear viscosity of hydrocarbon mixtures
[AD-A088236] N80-32459

Curable liquid hydrocarbon prepolymers containing hydroxyl groups and process for producing same
[NASA-CASE-NPO-13137-1] N80-32514

Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575

Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187388] N80-32577

Ecosystem theory and the unexpected: Implications for environmental toxicology
[CONF-800376-1] N80-32975

Effects of gasohol on idle HC and CO emissions
[PB80-190655] N80-33018

HYDROCYANIC ACID
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470

HYDROELECTRIC POWER STATIONS
Hydrogen production from remote power sites
[BNL-27457] N80-32553

Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964

HYDROGEN
Method of cross-linking polyvinyl alcohol and other water soluble resins
[NASA-CASE-LEW-13103-1] N80-32516

Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549

Catalyst characterization in coal liquefaction
[SAND-80-0123] N80-32560

Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32568

Assessment of hydrogen compressor technology for energy storage and transmission systems
[ORO-5598-T1] N80-32922

Ion chemistry in interstellar space
[NASA-CR-163580] N80-33188

Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01388-444] N80-33193

HYDROGEN CHLORIDES
The effect of designated pollutants on plant species
[AD-A078933] N80-32969

HYDROGEN IONS
Hydrogen hollow cathode ion source
[NASA-CASE-LEW-12940-1] N80-33186

Ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198

HYDROGEN PEROXIDE
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

HYDROGEN PRODUCTION
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469

Hydrogen production from remote power sites
[BNL-27457] N80-32553

Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-8] N80-32554

Fusion reactors for hydrogen production via electrolysis
[BNL-27782] N80-32559

Hydrogen production by photoelectrolytic decomposition of H2O using solar energy
[NASA-CR-163586] N80-32854

Fusion: An energy source for synthetic fuels
[BNL-27891] N80-33205

HYDROGEN RECOMBINATIONS
Hydrogen exchange in some coal-related reactions at 400 C
[CONF-800610-7] N80-32463

HYDROGENATION
Catalytic hydrogenation of coal-derived liquids
[FE-2034-18] N80-32558

Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32568

HYDROGEOLOGY
Hydrogeologic effects of natural disruptive events on nuclear waste respositories
[PNL-2858] N80-33206

HYDROGRAPHY
Preliminary estimate of regional effective ground-water recharge rates, related stream flow and water quality in Ohio
[PB80-193535] N80-32842

HYDROLOGY
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053

HYDROLOGY MODELS
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826

Preliminary estimate of regional effective ground-water recharge rates, related stream flow and water quality in Ohio
[PB80-193535] N80-32842
User's manual for hydrological simulation program: FORTRAN (HSPF)
[PB80-191109] N80-33004

HYDROLYSIS
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32886

HYDROPLANING
Pavement and geometric design criteria for minimizing hydroplaning. A technical summary
[PB80-190457] N80-32603

HYPERSONIC AIRCRAFT
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397

HYPERSONIC HEAT TRANSFER
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
Heat transfer and static stability tests of the General Purpose Heat Source (GPHS) configurations at Mach 8.0
[AD-A088031] N80-33287

HYPERSONIC WIND TUNNELS
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349

HYSTERESIS
AC losses in type-2 superconductors
[IS-M-280] N80-32679

I

ICE
Saint Lawrence River all-year navigation ice control system
[PB80-183478] N80-32841

ICE FORMATION
Saint Lawrence River all-year navigation ice control system
[PB80-183478] N80-32841

ICE MAPPING
Seasat-A land applications data processing plan
[E80-10317] N80-32810

IDEAL GAS
Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

IGNITION TEMPERATURE
Transient ignition mechanisms of confined solid propellants under rapid pressurization
[AD-A088080] N80-32539

IMAGE ENHANCEMENT
High Density Tape Reformatting System/LANDSAT Imagery Verification and Extraction System (HDTRS/LIVES) production test throughout analysis
[E80-10319] N80-32811

IMAGE INTENSIFIERS
Application of image intensifier technology to the military, scientific, industrial, educational, and medical communities
[AD-A088165] N80-32676

IMAGE PROCESSING
Target identification using radar imagery and moment methods
[AD-A088514] N80-32630
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32808
Seasat-A land applications data processing plan
[E80-10317] N80-32810
As-built design specification for equiproabability ellipses representation of CLASSY clusters
[E80-10320] N80-32812
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
As-built design specification for a list processing system
[E80-10325] N80-32816
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

IMAGE RESOLUTION
Investigation of photographic image quality estimators
[AD-A087805] N80-32702

IMAGERY
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064

IMAGING TECHNIQUES
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628
Application of image intensifier technology to the military, scientific, industrial, educational, and medical communities
[AD-A088165] N80-32676
Acoustic holography. Citations from the NTIS data base
[PB80-812530] N80-32707
Multispectral scanner optical system
[NASA-CASE-MSC-18255-1] N80-33210
Digital restoration of AC-coupled infrared images
[AD-A085430] N80-33213

IMPACT LOADS
Materials response to ultra-high loading rates --- with application to armor The state of understanding of the response of metals to ultrahigh loading rates is reviewed, with application to armor.
[NMAB-356] N80-32485
Shock compression of tantalum
[AD-A088152] N80-32499

IMPACT TESTS
An analysis of interlaminar stress gradients and impact damage in graphite-epoxy laminates
[AD-A088317] N80-32446
Ignition of NOS 365 liquid propellant containing an air bubble under simulated vreech pressurization conditions
[AD-A085723] N80-32538
Weathering tests on protective helmets approved to Australian standard AS 1698, for vehicle users
[AD-A084232] N80-32740
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778

IMPACTORS
Proceedings: Advances in Particle Sampling and Measurement
[PB80-187487] N80-33014

IMPEDANCE MATCHING
Radiation from an open-ended waveguide with beam equalizer. A spectral domain analysis
[AD-A088179] N80-32642

IMPEDANCE MEASUREMENTS
Apparatus for measuring semiconductor device resistance
[NASA-CASE-NPO-14424-1] N80-32650

IMPLANTED ELECTRODES (BIOLOGY)
Pocket ECG electrode
[NASA-CASE-ARC-11258-1] N80-33081

IMPLOSIONS
Beam nonuniformity effects on laser ablatively accelerated targets
[AD-A088056] N80-32711

IMPULSES
Experimental studies of impulsive noise produced by spheres moving through water
[AD-A084419] N80-33179

IMPURITIES
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32884

IN-FLIGHT MONITORING
Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360

INCENTIVES
Incentives for technological innovation in air pollution reduction: An ETIP policy research series. Volume 1: Emission offset policy at work. A summary analysis of 8 cases
[PB80-187610] N80-33022

INCINERATORS
Biomass energy production. Citations from the International Aerospace Abstracts data base
[PB80-810607] N80-32578

INCOMPRESSIBLE FLOW
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329

INDEPENDENT VARIABLES
On measuring the conformity of a parameter set to a trend, with applications
[AD-A087946] N80-33133

INDEXES (DOCUMENTATION)
Federal Laboratory Consortium resource directory
[PB80-199078] N80-32409

INDEXES (RATIOS)
Geomagnetic index calculation and use at AFGWC
[AD-A088234] N80-33043

INDIA
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

INDIAN SPACE PROGRAM
Satellite Instructional Television Experiment. Television comes to village: An evaluation of SITE
[ISRO-SAC-TR-09-78] N80-32611

INDIUM
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32915

INDIUM ALLOYS
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284

INDIUM PHOSPHIDES
A study of metal-semiconductor contacts on indium phosphide
[AD-A087666] N80-33256
Electronic process in InP and related compounds
[AD-A084260] N80-33261
Electronic processes in InP and related compounds
[AD-A088446] N80-33263

INDUSTRIAL ENERGY
Use of solar energy to produce process heat for industry
[SERI/TP-731-626] N80-32863
Comparison of solar-thermal and fossil total-energy systems for selected industrial applications
[ORNL/TM-7022] N80-32871
Potential for supplying solar thermal energy to industrial unit operations
[SERI/TP-632-584] N80-32911
International energy indicators
[DOE/IA-0010] N80-32918
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935
Simulation of the energy-industry-environment system for limited economic regions, using the example of Baden-Wuerttemberg. Part 1: Data, model development adaptation
[IKE-K-54-20-PT-1] N80-32974

INDUSTRIAL PLANTS
Coal demonstration plants
[DOE/FE-0004/79-2] N80-32555

INDUSTRIAL WASTES
Synthetic fuels from municipal, industrial and agricultural wastes. Citations from the American Petroleum Institute data base
[PB80-812365] N80-32579

INDUSTRIES
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462

INERTIAL FUSION (REACTOR)
Heavy ion beams for inertial fusion
[SLAC-PUB-2524] N80-33200

INERTIAL NAVIGATION
Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360

INFESTATION
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
The applicability of remote sensing to Earth biological problems. Part 2: The potential of remote sensing in pest management
[NASA-CR-163589] N80-32830

INFLATING
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32336

INFORMATION
The Science, Engineering, and Technology Program for the New Jersey Executive Branch
[PB80-190242] N80-33301

INFORMATION DISSEMINATION
A plan for a system to provide developmental information in Africa
[PB80-189806] N80-33315

INFORMATION FLOW
Data resources in housing and urban development
[PB80-188071] N80-33302

INFORMATION MANAGEMENT
Universal documentation system handbook. Volume 3: Program support plan and operations directive
[AD-A088222] N80-32415

INFORMATION SYSTEMS
Data quality indicators and their use in data base systems
[RAND/P-6491] N80-33292
Creating a science and technology information capacity for the Executive and Legislative Branches of the Delaware State Government
[PB80-190762] N80-33303
Symposium on International Standards Information and ISONET
[PB80-197221] N80-33304
Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305
Applying scientific and technological resources for North Dakota policy development: State Science, Engineering and Technology program
[PB80-189624] N80-33306
A plan for a system to provide developmental information in Africa
[PB80-189806] N80-33315

INFORMATION THEORY
Information analysis of dynamical radar parameters
[AD-A088195] N80-32641
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293

INFRARED ASTRONOMY
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334

INFRARED DETECTORS
Multispectral scanner optical system
[NASA-CASE-MSC-18255-1] N80-33210

INFRARED IMAGERY
Digital restoration of AC-coupled infrared images
[AD-A085430] N80-33213

INFRARED INSPECTION
Thermographic techniques applied to solar collector systems analysis
[SERI/TP-351-540] N80-32946

INFRARED PHOTOGRAPHY
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843

INFRARED RADIATION
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066
Optical and mechanical properties of infrared materials
[AD-A088120] N80-33216

INFRARED RADIOMETERS
Advanced very high resolution radiometer, Mod 2 engineering report
[NASA-CR-160034] N80-32701
High resolution infrared radiation sounder/mod 2 (HIRS/2)
[NASA-CR-160030] N80-33055
Reduction and assessment of infrared background data
[AD-A088241] N80-33218

INFRARED SCANNERS
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32430

INFRARED SPECTRA
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214

INFRARED SPECTROPHOTOMETERS
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468

INFRARED SPECTROSCOPY
Identification and quantification of hydrocarbon products in effluents
[AD-A088268] N80-32454
Far infrared studies of superconducting V3Si, Nb3Ge, and Nb
[DOE/ER-10436/1] N80-33283

INGOTS
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852

INJECTION LASERS
European fiber optics. USAF laboratory experts visit
[AD-A088209] N80-33217

INLET TEMPERATURE
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396

INORGANIC COMPOUNDS
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32831

INPUT/OUTPUT ROUTINES
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087564] N80-33111
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295

INSECTICIDES
The effect of designated pollutants on plant species
[AD-A078933] N80-32969

INSECTS
The applicability of remote sensing to Earth biological problems. Part 2: The potential of remote sensing in pest management
[NASA-CR-163589] N80-32830

INSPECTION
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088278] N80-32782

INSTRUMENT ORIENTATION
Azimuth observability enhancement during INS in-flight alignment
[TAE-362] N80-32360

INSULATION
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678

INSULATORS
Characteristics of insulating oil for electrical application
[EPRI-EL-1300] N80-32681
Electro-optical measurements of solid insulator surface fields and surface charging in vacuum
[PB80-192875] N80-32685
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257

INTEGRAL EQUATIONS
On the theory of flow of regular water wave about a body
[AD-A084359] N80-32693
Approximation schemes for the linear-quadratic optimal control problem associated with delay equations
[AD-A088245] N80-33121
The Riccati integral equation arising in optimal control of delay differential equations
[AD-A088097] N80-33122
Generic properties of an integro-differential equation
[AD-A088242] N80-33129

INTEGRATED CIRCUITS
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585
A monolithic GaAs IF amplifier for integrated receiver applications
[AD-A088298] N80-32670

INTEGRATED OPTICS
Integrated optical logic gates. A demonstration of four optical logic functions
[AD-A087999] N80-33215

INTERATOMIC FORCES
Interatomic forces in solid and liquid transition metals
[AD-A087672] N80-32492

INTERFACES
Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754

INTERFACIAL ENERGY
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437

INTERFACIAL TENSION
Finite elements for contact problems in two-dimensional elastodynamics N80-32772

INTERFERENCE DRAG
Afterbody drag. Volume 2: Jet interference effects on subsonic boattail drag
[AD-A087515] N80-32342

INTERFEROMETERS
Laser angle measurement system
[NASA-CR-159306] N80-32405

INTERFEROMETRY
Interferometric locating system
[NASA-CASE-NPO-14173-1] N80-32359
Flaw detection and evaluation of composite cylinders using laser speckle interferometry and holography
[AD-A088206] N80-32447

INTERGRANULAR CORROSION
Application of analytical electron microscopy to the study of intergranular corrosion in 304 stainless steel
[BNL-27344] N80-32506

INTERMEDIATE FREQUENCY AMPLIFIERS
A monolithic GaAs IF amplifier for integrated receiver applications
[AD-A088298] N80-32670

INTERNAL COMBUSTION ENGINES
Numerical simulation of reactive flow in internal combustion engines
[LA-UR-80-1633] N80-32730
Potential of spark ignition engine, 1979 summary source document
[PB80-191034] N80-32737
Comparative analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-52933] N80-32907
Analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-83824] N80-32940

INTERNAL WAVES
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075

INTERNATIONAL TRADE
Symposium on International Standards Information and ISONET
[PB80-197221] N80-33304

INTERPLANETARY FLIGHT
Titan probe technology assessment and technology development plan study
[NASA-CR-152361] N80-32417
INTERPOLATION
Nonanalytic function generation routines for 16-bit microprocessors
[NASA-TM-81586] N80-33104
INVERTERS
Open-cycle MHD power conditioning and control requirements definition
[EPRI-AP-1345] N80-32864
INVISCID FLOW
Theoretical calculation of viscous-inviscid transonic flows
[AD-A087745] N80-32348
IODINE
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469
ION BEAMS
Heavy ion beams for inertial fusion
[SLAC-PUB-2524] N80-33200
New concept for a high-power beam dump
[UCRL-83696] N80-33208
Tokamak heating and current maintenance with intense pulsed ion beams
[AD-A088274] N80-33230
ION CYCLOTRON RADIATION
Nonlinear ion-cyclotron waves in mirror machines
[UCRL-83517] N80-33236
ION EXCHANGING
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32569
ION EXTRACTION
ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198
ION MOTION
Influence of ion motion in the inverse Faraday effect
[INPE-1764-RPE/153] N80-33189
ION PRODUCTION RATES
Ion production in the D-region — through cosmic rays during solar flares and geomagnetic storms
[AD-A085533] N80-33038
A study of secondary ion triple bond analogues
[AD-A088423] N80-33262
ION SOURCES
Hydrogen hollow cathode ion source
[NASA-CASE-LEW-12940-1] N80-33186
IONIZATION
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
IONIZATION COEFFICIENTS
Electronic proces in InP and related compounds
[AD-A084260] N80-33261
Electronic processes in InP and related compounds
[AD-A088446] N80-33263
IONOGRAMS
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028
IONOSONDES
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028
IONOSPHERE
Ionospheric F-region response to geomagnetic storms, over Brazilian low latitude
[INPE-1835-RPE/197] N80-33025
IONOSPHERIC DISTURBANCES
System description for the Airborne-Omega Data Bank
[AD-A087608] N80-32373
Satellite sensing of the solar-terrestrial environment and real-time radio propagation forecasting. Lessons learned from PROPHET. Volume 1: Executive summary
[AD-A088170] N80-32640
The microwave applications theory program at NRL and some chemistry code applications to ionospheric heating by microwave radiation
[AD-A088275] N80-33039
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328
Solar-geophysical data number 427, March 1980, part 1 (Prompt reports)
[PB80-194871] N80-33329
IONOSPHERIC ELECTRON DENSITY
Comparison of changes in the ionospheric total electron content at mid-latitude locations few hundred kilometers apart
[INPE-1798-RPE/166] N80-33029
IONOSPHERIC F-SCATTER PROPAGATION
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037
IONOSPHERIC PROPAGATION
Experimental measurements of ambient electromagnetic noise from 1.0 to 4.0 kHz
[AD-A088090] N80-32638
Satellite sensing of the solar-terrestrial environment and real-time radio propagation forecasting. Lessons learned from PROPHET. Volume 1: Executive summary
[AD-A088170] N80-32640
Wave disturbances in the low latitude ionosphere and equatorial ionosphere plasma depletions
[INPE-1806-RPE/174] N80-33027
IRON ALLOYS
High toughness-high strength iron alloy
[NASA-CASE-LEW-12542-3] N80-32484
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488
IRRIGATION
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-32846
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
ISENTROPIC PROCESSES
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397
Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575
ISOSTATIC PRESSURE
Analytical modeling of the hot isostatic pressing process
[AD-A088208] N80-32593
ISOTHERMAL LAYERS
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045
ISOTHERMAL PROCESSES
Low-pressure performance of annular, high-pressure (40 atm) high-temperature (2480 K) combustion system
[NASA-TP-1713] N80-32396
Isothermal roll forging of T55 compressor blades, phase 2
[AD-A088076] N80-32495
ISOTOPES
Anomalous isotopic composition of cosmic rays
[UCRL-84561] N80-33335
ISOTOPIC LABELING
A technique for the injection of radioactive tracer microspheres during acceleration stress
[AD-A087931] N80-33087
ISOTROPIC TURBULENCE
Effects of axisymmetric contractions on turbulence of various scales
[NASA-CR-165136] N80-32328
ISOTROPY
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796
ITALY
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
ITERATIVE SOLUTION
Newton's method: A link between continuous and discrete solutions of nonlinear problems N80-32759
Iterative methods based upon residual averaging N80-32762
IUE
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

J

JACOBI MATRIX METHOD
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093
JET AIRCRAFT NOISE
A new theory for rapid calculation of the ground pattern of the incident sound intensity produced by a maneuvering jet airplane
[NASA-TP-1733] N80-32334
Study of lateral excess sound attenuation as determined from far part 36 aircraft noise certification measurements
[AD-A088285] N80-33183
Computer program to add noisemap grids of different spacings
[AD-A086205] N80-33185
JET ENGINE FUELS
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
JET ENGINES
Engine bleed air reduction in DC-10
[NASA-CR-159846] N80-32378
JET FLOW
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177
JET PROPULSION
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397
Project SQUID
[AD-A088006] N80-32401
JOINTS (JUNCTIONS)
Low-temperature solder for joining large cryogenic structures --- cooling cools for the National Transonic Facility
[NASA-TM-81836] N80-32490
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748
JOSEPHSON JUNCTIONS
Present and future trends in signal processing technologies
[AD-A088085] N80-32634
Josephson A/D converter development
[AD-A087671] N80-32657
JP-4 JET FUEL
Service test of two fuel conductivity additives
[AD-A088046] N80-32540
JUPITER ATMOSPHERE
Survey of the plasma electron environment of Jupiter: A view from Voyager
[NASA-TM-80731] N80-33325

K

KALMAN FILTERS
The off-line use of a sequential estimator
[AD-A088178] N80-33142

KANSAS
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

KINETIC ENERGY
Inertial confinement fusion systems using heavy ion accelerators as drivers
[SLAC-PUB-2490] N80-33201

KNOOP HARDNESS
Optical and mechanical properties of infrared materials
[AD-A088120] N80-33216

KNOWLEDGE
Knowledge acquisition, knowledge programming, and knowledge refinement
[RAND/R-2540-NSF] N80-33120

L

LABORATORIES
Federal Laboratory Consortium resource directory
[PB80-199078] N80-32409

LAGOONS
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
Rock filters for removal of algae from lagoon effluents
[PB80-190077] N80-33016

LAMELLA
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792

LAMINAR BOUNDARY LAYER
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351

LAMINAR FLOW
The design of a fluidic oxygen intermittent demand flow device
[AD-A084083] N80-33097
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309

LAMINATES
Effect of load history on fatigue life
[AD-A088439] N80-32445
An analysis of interlaminar stress gradients and impact damage in graphite-epoxy laminates
[AD-A088317] N80-32446
Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754
Laminated, composite flywheel failure analysis
[UCRL-15164] N80-32908

LAND MANAGEMENT
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316

LAND USE
Micro-level land use impacts of bioconversion
[LA-UR-80-1426] N80-32562
Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32805
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963

LANDING AIDS
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363

LARGE AREA CROP INVENTORY EXPERIMENT
As-built design specification for CCIT8 processor program
[E80-10323] N80-32814
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818

LARGE SPACE STRUCTURES
Technology for large space systems. A special bibliography with indexes, supplement 3
[NASA-SP-7046(03)] N80-32410
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319

LASER APPLICATIONS
Chemical reactions in turbulent mixing
[AD-A088529] N80-32694
Thermal characteristics of Discharge-heated Cooper Vapor Laser (DHCVL) heat shields formed of multiple coaxial cylinders
[UCRL-83649] N80-32714
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257

LASER DOPPLER VELOCIMETERS
Beam nonuniformity effects on laser ablatively accelerated targets
[AD-A088056] N80-32711

LASER FUSION
Beam nonuniformity effects on laser ablatively accelerated targets
[AD-A088056] N80-32711
Rare gas halide lasers for fusion N80-32713
Optical coatings for laser fusion applications
[UCRL-83582] N80-33238
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245

LASER GYROSCOPES
Applications of advanced electric/electronic technology to conventional aircraft
[NASA-CR-163576] N80-32375

LASER HEATING
Flash pyrolysis and gasification of coal through laser heating
[LA-UR-80-1094] N80-32573

LASER OUTPUTS
Laser angle measurement system
[NASA-CR-159306] N80-32405
Investigation of discharge processes in electrically excited blue/green lasers
[AD-A087682] N80-32710

LASER PLASMAS
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223

LASER RANGE FINDERS
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856

LASER TARGET DESIGNATORS
OH-58C helicopter mast mounted sight/designator safety statement
[AD-A087673] N80-32390

LASER TARGETS
Beam nonuniformity effects on laser ablatively accelerated targets
[AD-A088056] N80-32711
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245

LASERS
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570
Automating the E-beam laser
[AD-A079529] N80-32709

LATITUDE
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028

LATTICES (MATHEMATICS)
On nearest neighbor degeneracies of indistinguishable particles
[AD-A088247] N80-33155

LAUNCH DATES
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424

LAUNCHERS
Dynamic technique for launching stratospheric balloons with experiments weighing more than 500 Kg aboard
[INPE-1821-RPE/187] N80-32340

LAW (JURISPRUDENCE)
Colorado General Assembly science and technology resource needs assessment study
[PB80-189491] N80-33299

LEAD ALLOYS
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284

LEAKAGE
Integral aircraft fuel tank leak classification
[AD-A088168] N80-32388
Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171

LEARNING THEORY
The free-body diagram revisited
[AD-A087952] N80-33173

LEAST SQUARES METHOD
A continued fraction representation for Theodorsen's circulation function
[NASA-TM-81838] N80-32330
The off-line use of a sequential estimator
[AD-A088178] N80-33142

LEGIBILITY
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100

LESIONS
Radiofrequency lesion generators, a problem definition study
[PB80-191844] N80-33079

LEVITATION
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245

LIBRARIES
Applying scientific and technological resources for North Dakota policy development: State Science, Engineering and Technology program
[PB80-189624] N80-33308

LIE GROUPS
Supralgebras, supergroups and geometric gauging
[ORO-3992-384] N80-33169

LIFE CYCLE COSTS
Advanced structures concepts r and m/cost assessments --- helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374
Availability/operational readiness test subsystem cost tradeoffs
[AD-A088201] N80-32743

LIFE SUPPORT SYSTEMS
Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586
Improved low-drag ground vehicle particularly suited for use in safely transporting livestock
[NASA-CASE-FRC-11058-1] N80-33312

LIFT
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347

LIGHT CURVE
Supernova models and light curves
[UCRL-84578] N80-33323

LIGHT SCATTERING
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748

LIGHTNING
Improved test methods for determining lightning-induced voltages in aircraft
[NASA-CR-3329] N80-32379

LIGNITE
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
LINE OF SIGHT
Atlas of cloud-free line-of-sight probabilities. Part 5: North Africa and the Middle East
[AD-A088156] N80-33069
LINE SPECTRA
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1863-RPE/213] N80-33322
LINEAR ACCELERATORS
Heavy ion beams for inertial fusion
[SLAC-PUB-2524] N80-33200
LINEAR ARRAYS
Development of ultrasonic tomography for residual stress mapping --- in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798
LINEAR EQUATIONS
Newton's method: A link between continuous and discrete solutions of nonlinear problems N80-32759
LINEAR PROGRAMMING
How many steps?
[AD-A087860] N80-33107
LINEAR SYSTEMS
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Numerical regularization of ill-posed problems
[AD-A088073] N80-33138
Qualitative matrices: Strong sign-solvability and weak satisfiability
[AD-A087686] N80-33168
LINEAR TRANSFORMATIONS
Building block for an orthonormal-lattice-filter adaptive network
[AD-A088088] N80-32671
LINEARITY
Confidence intervals on nonnegative linear combinations of variances
[AD-A084194] N80-33151
LINES (GEOMETRY)
Computer treatment of perspective for solids
[INPE-1785-RPE/157] N80-33105
LIQUEFIED GASES
Acoustic microscopy at cryogenic temperatures
[AD-A087677] N80-32589
LIQUID COOLING
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
LIQUID CRYSTALS
New instrumentation for temperature measurement. Phase 1: Program solicitation, small business innovation research
[PB80-184682] N80-32705
LIQUID METALS
Interatomic forces in solid and liquid transition metals
[AD-A087672] N80-32492
Development of a low loss magnetic composite utilizing amorphous metal flake
[CONS-3205-T1] N80-32509
LIQUID NITROGEN
Modeling and control of transonic cryogenic wind tunnels
[NASA-CR-163588] N80-32403
LIQUID PHASE EPITAXY
Electronic processes in InP and related compounds
[AD-A088446] N80-33263
LIQUID PHASES
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535
LIQUID-VAPOR EQUILIBRIUM
Analysis of liquid volume and liquid mass fractions at coexistence for pure fluids
[PB80-191133] N80-32481
LITHIUM
Lithium batteries. Citations from the NTIS data base
[PB80-812399] N80-32967
Lithium batteries. Citations from the Engineering Index data base
[PB80-812407] N80-32968
LOAD TESTS
Materials response to ultra-high loading rates --- with application to armor The state of understanding of the response of metals to ultrahigh loading rates is reviewed, with application to armor.
[NMAB-356] N80-32485
The method of lines in three dimensional fracture mechanics
[NASA-TM-81593] N80-32753
LOADING OPERATIONS
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32384
LOADS (FORCES)
Effect of load history on fatigue life
[AD-A088439] N80-32445
Straightening of a wavy strip: An elastic-plastic contact problem including snap-through N80-32768
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
Technique for studying multiple fractures produced at intermediate loading rates
[UCRL-83653] N80-32797
Finite element stress analysis of a compression mold
[BDX-613-2387] N80-32801
A minimum excursion-time control system
[AD-A087774] N80-33096
LOCOMOTION
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093
LOGIC DESIGN
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293
LOGICAL ELEMENTS
Integrated optical logic gates. A demonstration of four optical logic functions
[AD-A087999] N80-33215
LOGISTICS
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326
Universal documentation system handbook. Volume 3: Program support plan and operations directive
[AD-A088222] N80-32415
LONG RANGE WEATHER FORECASTING
Stepwise linear regression experiments in 14- and 19-day hemispheric weather prediction
[INPE-1757-RPE/146] N80-33049
LONGITUDINAL CONTROL
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338
LORAN C
Loran-based buoy position auditing systems: Analytical evaluation
[AD-A088266] N80-32369
LOW ASPECT RATIO WINGS
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347
Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382
LOW CARBON STEELS
Crack tip plasticity associated with corrosion assisted fatigue --- low carbon steel
[AD-A087961] N80-32783
LOW COST
Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
LOW PASS FILTERS
A simplified digital filter design
[AD-A087772] N80-32658
LOW TEMPERATURE
Heat pumps in low temperature applications
[CONF-800806-7] N80-32699
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209
LOW TEMPERATURE ENVIRONMENTS
Acoustic microscopy at cryogenic temperatures
[AD-A087677] N80-32589
LOW TEMPERATURE TESTS
Low-temperature solder for joining large cryogenic structures --- cooling cools for the National Transonic Facility
[NASA-TM-81836] N80-32490
LUBRICANTS
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
LUMINESCENCE
Luminescent tellurium-doped cadmium sulfide electrodes as probes of semiconductor excited-state deactivation processes in photoelectrochemical cells
[AD-A088532] N80-32451
LUMINOUS INTENSITY
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032
LUXEMBOURG
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

M

MACH NUMBER
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
MACHINING
Conventional machining of ESR 4340 steel
[AD-A088451] N80-32591
MAGMA
Development of high temperature viscosity measurement technique
[SAND-80-0641] N80-32476
MAGNESIUM
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834
MAGNESIUM FLUORIDES
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444
MAGNET COILS
A-15 superconducting composites in the 0.1 micron region --- casting alloys for magnet wire
[IS-M-274] N80-33274
MAGNETIC ANOMALIES
Electromagnetic fields induced by ocean currents
[AD-A085727] N80-32627
MAGNETIC DISTURBANCES
Geomagnetic index calculation and use at AFGWC
[AD-A088234] N80-33043
MAGNETIC FIELD CONFIGURATIONS
Tandem mirror reactors with thermal barriers
[UCRL-83505] N80-33244
MAGNETIC FIELDS
Calculation of the Biot-Savart law magnetic field using current distributions obtained from a finite element analysis
[AD-A088094] N80-33172
A functional for finite element analysis of low intensity magnetic fields including permanent magnetization effects
[AD-A088230] N80-33174
Influence of ion motion in the inverse Faraday effect
[INPE-1764-RPE/153] N80-33189
Ion energy recovery experiment based on magnetic electro suppression
[ORNL/TM-7283] N80-33198
A diverted plasma reversed field pinch
[AD-A088049] N80-33225
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
Tokamak heating and current maintenance with intense pulsed ion beams
[AD-A088274] N80-33230
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295
MAGNETIC FLUX
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507

MAGNETIC INDUCTION
Approximate calculations of radiation-induced currents
[AD-A087893] N80-32614
MAGNETIC MATERIALS
Development of a low loss magnetic composite utilizing amorphous metal flake
[CONS-3205-T1] N80-32509
MAGNETIC MIRRORS
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
Tandem mirror fusion-fission hybrid studies
[UCRL-84018] N80-33237
Plasma confinement experiments in the TMX tandem mirror
[UCRL-83515] N80-33241
MAGNETIC RECORDING
Recording media archival attributes (magnetic)
[AD-A088187] N80-32704
MAGNETIC STORMS
Ionospheric F-region response to geomagnetic storms, over Brazilian low latitude
[INPE-1835-RPE/197] N80-33025
MAGNETIC SUSPENSION
Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897
MAGNETIC TAPES
Recording media archival attributes (magnetic)
[AD-A088187] N80-32704
MAGNETIZATION
A functional for finite element analysis of low intensity magnetic fields including permanent magnetization effects
[AD-A088230] N80-33174
MAGNETOHYDRODYNAMIC FLOW
Numerical modelling of an end-plugged theta pinch
[MSNW-80-1146-2] N80-33231
Reversed-field pinch fusion reactor
[LA-UR-80-1494] N80-33246
MAGNETOHYDRODYNAMIC GENERATORS
Open-cycle MHD power conditioning and control requirements definition
[EPRI-AP-1345] N80-32864
Open-cycle MHD systems analysis
[EPRI-AP-1316] N80-32881
Engineering test facility conceptual design --- for magnetohydrodynamic generators
[DOE/FE-2614/3] N80-32943
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33228
MAGNETOHYDRODYNAMIC STABILITY
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
MAGNETOHYDRODYNAMICS
Studies in tandem mirror theory
[UCRL-83519-REV-1] N80-33234
Initial reversed-field pinch experiments on ZT-40 and recent advances in RFP theory
[LA-UR-80-1834] N80-33248
MAGNETOMETERS
Electromagnetic fields induced by ocean currents
[AD-A085727] N80-32627
MAGNETOPLASMADYNAMICS
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856
MAGNETOSPHERE
Quantitative simulation of a magnetospheric storm. 3: Plasmaspheric electric fields and evolution of the plasmapause
[NASA-CR-163455] N80-33041
Geomagnetic index calculation and use at AFGWC
[AD-A088234] N80-33043
Survey of the plasma electron environment of Jupiter: A view from Voyager
[NASA-TM-80731] N80-33325
MAGNETRON SPUTTERING
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505
MAGNETS
Advanced AN/TPQ-37 transmitter tube
[AD-A088235] N80-32675
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278
MAINE
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
MAINTAINABILITY
Advanced structures concepts r and m/cost assessments --- helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374
MAINTENANCE
Advanced structures maintenance concepts
[AD-A087609] N80-32324
New concept study for repair of bomb-damaged runways. Volume 1: Concept identification
[AD-A088188] N80-32407
Operation and maintenance cost data for residential photovoltaic modules/panels
[NASA-CR-163585] N80-32855
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
MAN ENVIRONMENT INTERACTIONS
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
A methodology for the environmental assessment of advanced coal extraction systems
[NASA-CR-163570] N80-32827
MAN MACHINE SYSTEMS
Future directions for decision support
[AD-A087355] N80-33289
MANAGEMENT METHODS
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462
MANAGEMENT PLANNING
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326
Costing methodologies for energy systems
[BNL-27603] N80-32900
MANUALS
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
MANUFACTURING
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462
Silicon concentrator solar cell manufacturing development
[SAND-80-7018] N80-32886
MANY BODY PROBLEM
A collinear N-body problem of classical electrodynamics
[AD-A088114] N80-32456
Self-consistent many body theory for standard basis operator Green's function: An application to anisotropic ferromagnets
[INPE-1824-RPE/190] N80-33170
Electron correlations in narrow bands
[INPE-1813-RPE/181] N80-33255
MAPPING
Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32805
ICMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
Horizontal datums for nautical charts
[AD-A088340] N80-32839
MARINE BIOLOGY
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075
MARKETING
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547
Proceedings of the Ocean Energy Information Dissemination Workshop
[SERI/TP-732-600] N80-32956
Department of Housing and Urban Development solar hot water initiative: Centralized coordination of technical tasks and system evaluation
[PB80-189244] N80-32961
MARKOV CHAINS
On the first passage time distribution for a class of Markov chains
[AD-A088111] N80-33159
MARKOV PROCESSES
Evaluation of computing systems using functionals of a Stochastic process
[NASA-CR-163512] N80-33102
On nearest neighbor degeneracies of indistinguishable particles
[AD-A088247] N80-33155
MARS SURFACE
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652
MARTENSITE
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
MASS FLOW RATE
Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575
MASS SPECTROMETERS
Use of an automated mass spectrometer for an underground coal gasification field test
[UCRL-84366] N80-32565
MASS SPECTROSCOPY
Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187388] N80-32577
MASS TRANSFER
Appraisal of the M factor and the role of building thermal mass in energy conservation
[ORNL/CON-46] N80-32958
MATERIAL BALANCE
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483
MATERIALS HANDLING
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32384
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585
MATERIALS RECOVERY
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812449] N80-32581
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812456] N80-32582
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32866
MATHEMATICAL LOGIC
A generalized decision support system using predicate calculus and network data base management
[AD-A088079] N80-33166
MATHEMATICAL MODELS
Advanced restraint system modeling
[AD-A088029] N80-32357
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425
An analysis of interlaminar stress gradients and impact damage in graphite-epoxy laminates
[AD-A088317] N80-32446
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-8] N80-32554
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32590
Analytical modeling of the hot isostatic pressing process
[AD-A088208] N80-32593
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594
Thermodynamic properties of solid helium using an anharmonic anisotropic continuum model
[DOE/ER-01198/1314] N80-32598
A bounds on the resonant frequency of rectangular microstrip antennas
[NASA-TM-81882] N80-32609
Analysis of a finite length tubular monopole antenna driven by a coaxial line
[SAND-79-1557] N80-32647
Building block for an orthonormal-lattice-filter adaptive network
[AD-A088088] N80-32671
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
Theoretical and experimental investigation of coherent structure in the turbulent boundary layer
[AD-A088248] N80-32696
Numerical simulation of reactive flow in internal combustion engines
[LA-UR-80-1633] N80-32730
Potential of spark ignition engine, effect of vehicle design variables on top speed, performance, and fuel economy
[PB80-191836] N80-32736
On the constitutive laws for the large strain cylindrical deformations of shells
[TAE-370] N80-32750
Research in nonlinear structural and solid mechanics
[NASA-CP-2147] N80-32756
Self-adaptive incremental Newton-Raphson algorithms N80-32764
Bending behavior of lapped plastic EHV cables
[BNL-27331] N80-32789
Plastic deformation of colliding hemishells
[LA-UR-80-1659] N80-32794
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Simulation model for assessing building energy-conservation policies
[BNL-27802] N80-32901
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/4] N80-32920
Line-focus solar central power system, phase 1. Subsystem experiment: Receiver heat transfer
[DOE/ET-20550/1] N80-32945
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Performance of simple models for stack plume dispersion during convective conditions
[PB80-191869] N80-33001
Efficient algorithms for solving systems of ordinary differential equations for ecosystem modeling
[PB80-190986] N80-33002
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009
A mathematical model of electrostatic precipitation, revision 2
[PB80-190994] N80-33019
Potential coefficient and anomaly degree variance modeling revisited
[AD-A082322] N80-33023
Definition of gust model concept and review of gust models
[PNL-3138] N80-33072
Evaluation of computing systems using functionals of a Stochastic process
[NASA-CR-163512] N80-33102
Functional difference equations and an epidemic model
[AD-A088108] N80-33135
Automatic multirate methods for ordinary differential equations
[COO-2383-0062] N80-33147
The influence curve and goodness of fit
[AD-A085593] N80-33152
Numerical modelling of an end-plugged theta pinch
[MSNW-80-1146-2] N80-33231
High angle grain boundaries as sources or sinks for point defects
[DOE/ER-05002/8] N80-33279
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33282
Future directions for decision support
[AD-A087355] N80-33289

MATRICES (MATHEMATICS)
Matrix theory of elastic wave scattering: Application to scattering of transverse waves
[UCRL-84116] N80-32649
How many steps?
[AD-A087860] N80-33107
Invertible binary matrices --- techniques in digital network synthesis
[AD-A085575] N80-33128
On the almost sure convergence of weighted sums of random elements in D(0, 1)
[AD-A088330] N80-33144
Scattering matrix analysis of surface acoustic wave reflections and transducers
[AD-A085764] N80-33180

MATRIX MATERIALS
Research on graphite reinforced glass matrix composites
[NASA-CR-159312] N80-32440

MAXIMUM LIKELIHOOD ESTIMATES
Estimators for the truncated beta-binomial distribution
[CONF-800644-1] N80-33148
Likelihood ratio tests for and against a stochastic ordering between multinomial populations tests for a stochastic ordering
[AD-A088194] N80-33163

MEANDERS
The Gulf Stream Meanders experiment: Current meter, atmospheric, and sea level data report for the mooring period
[AD-A088069] N80-33077

MEASURE AND INTEGRATION
Automatic multirate methods for ordinary differential equations
[COO-2383-0062] N80-33147

MECHANICAL DEVICES
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556

MECHANICAL DRIVES
Redundant motor drive system
[NASA-CASE-MFS-23777-1] N80-32716
Belt for transmitting power from a cogged driving member to a cogged driven member
[NASA-CASE-GSC-12289-1] N80-32717

MECHANICAL PROPERTIES
Mechanical properties versus morphology of ordered polymers
[AD-A087927] N80-32520
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796
Development of cellulose flywheel rotors
[SAND-79-7099] N80-32882
Optical and mechanical properties of infrared materials
[AD-A088120] N80-33216

MECHANICAL SHOCK
Environmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416

MEDICAL ELECTRONICS
Pocket ECG electrode
[NASA-CASE-ARC-11258-1] N80-33081

MEDICAL EQUIPMENT
Radiofrequency lesion generators, a problem definition study
[PB80-191844] N80-33079

MELTING
Crystal growth by skull melting
[AD-A088013] N80-33269

MEMBRANE STRUCTURES
Structure and function in photosynthetic membranes and their components
[COO-3162-51] N80-33078

MESOSCALE PHENOMENA
Use of helium-3 as a gas tracer for meso-scale meteorological studies
[DP-MS-79-51] N80-33070

MESOSPHERE
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
Mesopheric winds from lidar observations of atmospheric sodium
[INPE-1811-RPE/179] N80-33051

MESSAGE PROCESSING
Discrete Address Beacon System (DABS) front end processor en route central computer complex protocol
[AD-A085482] N80-32367
Distributed network protocols
[AD-A087623] N80-33117

METABOLISM
Development of analytical techniques for toxicokinetic research
[AD-A077729] N80-33080
Metabolic aspects of caloric restriction (500 calories): Body composition changes
[AD-A082495] N80-33095

METAL AIR BATTERIES
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878
Comparative analysis of aluminum-air battery propulsion systems for passenger vehicles
[UCRL-52933] N80-32907
Aluminum air battery for electric vehicle propulsion
[UCRL-84443] N80-32941

METAL COATINGS
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512

METAL CRYSTALS
Initial stages of oxidation of metals and alloys
[DOE/ER-10501/1] N80-32500
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
Study of grain boundary segregation using the Auger electron emission technique
[DOE/ER-02166] N80-33280

METAL DRAWING
Isothermal roll forging of T55 compressor blades, phase 2
[AD-A088076] N80-32495

METAL FATIGUE
Crack tip plasticity associated with corrosion assisted fatigue --- low carbon steel
[AD-A087961] N80-32783

METAL FILMS
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284

METAL HYDRIDES
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-6] N80-32554

METAL JOINTS
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792

METAL MATRIX COMPOSITES
Metal matrix composites. A bibliography with abstracts
[PB80-811912] N80-32513

best copy available

METAL OXIDE SEMICONDUCTORS
Radiation evaluation study of LSI RAM technologies
[AD-A084168] N80-32660

METAL OXIDES
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32487
Ceramic coatings on diesel engine components
[DOE/ET-15320/T1] N80-32732

METAL PLATES
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778

METAL POWDER
Analytical modeling of the hot isostatic pressing process
[AD-A088208] N80-32593

METAL SURFACES
Vibrational frequencies of halogen atoms adsorbed on silver metal surfaces
[AD-A087664] N80-32491
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
Initial stages of oxidation of metals and alloys
[DOE/ER-10501/1] N80-32500
Chemical reactions on solid surfaces using molecular beam techniques
[AD-A088447] N80-33266

METAL-METAL BONDING
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724

METALLIC GLASSES
Electronic structure and stability of metallic glasses
[AD-A088292] N80-33267

METALS
Fundamentals of corrosion fatigue behavior of metals and alloys
[AD-A088358] N80-32496
Simulation of short-term annealing of displacement cascades in FCC metals
[HEDL-SA-2147-FP] N80-33282

METEOROLOGICAL BALLOONS
Dynamic technique for launching stratospheric balloons with experiments weighing more than 500 Kg aboard
[INPE-1821-RPE/187] N80-32340

METEOROLOGICAL FLIGHT
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047

METEOROLOGICAL PARAMETERS
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
Environmental data for sites in the National Solar data network
[SOLAR/0010-80/05] N80-32986
Revised Uniform Summary of Surface Weather Observations (RUSSWO) Monterey FAA, Monterey, California,, parts A, C-F
[AD-A087826] N80-33059
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063
Passive 19.3 GHz radiometer and aerosol data from the North Sea during MARSEN I, September - October 1979
[AD-A088229] N80-33068

METEOROLOGICAL SERVICES
The effect of the Western Union Weather Data System on the preflight briefing position at the Chicago Flight Service Station
[AD-A088415] N80-33065

METEOROLOGY
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829

METHANE
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Ultra high resolution inverse Raman spectroscopy of methane in a CW free expansion jet
[SAND-80-1370C] N80-32466
Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472
Study of methane fuel for subsonic transport aircraft
[NASA-CR-159320] N80-32533
Automotive fuels from cellulose materials
[NZERDC-49] N80-32571
The occurrence and behavior of halomethanes in the aquatic environment
[PB80-190317] N80-32996

METHYL ALCOHOLS
Modifications for use of methanol or methanol-gasoline blends in automotive vehicles
[ALO-3682-T1] N80-32552
Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32601

METHYL COMPOUNDS
Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472

METHYL POLYSILOXANE
Structure-property relationships of linear methyl-phenyl-vinyl siloxane terpolymers
[UCRL-84303] N80-32529

METROLOGY
Metrology data reduction system: PDP-11/34 computer system
[BDX-613-2402] N80-32599

MICROCLIMATOLOGY
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066

MICROCOMPUTERS
Automating the E-beam laser
[AD-A079529] N80-32709
Microcomputer system for medium-sized and experimental finite element analysis N80-32776
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
Microcode verification project
[AD-A088189] N80-33110
Microcomputer-based natural-language understanding, phase 1
[PB80-187370] N80-33116
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295

MICROELECTRONICS
Accelerated life testing effects on CMOS microcircuit characteristics
[NASA-CR-161575] N80-32653
Automatic visual inspection of hybrid microcircuits
[BDX-613-2359] N80-32747

MICROMETEOROLOGY
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

MICROPROCESSORS
Solid state audio/speech processor analysis
[AD-A084743] N80-32623
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
A microprocessor-based cardiotachometer
[NASA-CR-160607] N80-33082
Nonanalytic function generation routines for 16-bit microprocessors
[NASA-TM-81586] N80-33104
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295

MICROSONICS
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33268

MICROSTRIP TRANSMISSION LINES
Multiple band circularly polarized microstrip antenna
[NASA-CASE-MSC-18334-1] N80-32604

MICROSTRUCTURE
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
Microstructure and tensile properties of heavily irradiated 5052-0 aluminum alloy
[CONF-800609-3] N80-32511
Mechanical properties versus morphology of ordered polymers
[AD-A087927] N80-32520
High angle grain boundaries as sources or sinks for point defects
[DOE/ER-05002/8] N80-33279

MICROWAVE ATTENUATION
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056

MICROWAVE FREQUENCIES
Advanced communications satellites
[NASA-TM-81599] N80-32608

MICROWAVE IMAGERY
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054

MICROWAVE OSCILLATORS
S and Ku band frequency source development
[NASA-CR-160033] N80-32654
Design, fabrication and evaluation of low cost diode oscillator for millimeter waves
[AD-A087954] N80-32667

MICROWAVE RADIOMETERS
Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32655

MICROWAVE SCANNING BEAM LANDING SYSTEM
Flight performance of the TCV B-737 airplane at Montreal/Dorval International Airport, Montreal, Canada, using TRSB/MLS guidance
[NASA-TM-81885] N80-32361

MICROWAVE SPECTRA
Microwave properties of low density (CH) sub x
[AD-A086943] N80-32518

MICROWAVES
The microwave applications theory program at NRL and some chemistry code applications to ionospheric heating by microwave radiation
[AD-A088275] N80-33039
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227

MILITARY OPERATIONS
The US Air Service in World War I. Volume 3: The Battle of Saint Mihiel
[AD-A088294] N80-32327

MILLIMETER WAVES
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617
Multipath propagation over snow at millimeter wavelengths
[AD-A087747] N80-32618
Millimeter wave radar system concept study, phase 1
[AD-A087767] N80-32620
Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669
Basic research in electronics, JSEP
[AD-A088121] N80-32672

MINERAL EXPLORATION
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163589] N80-32828
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193861] N80-32845

MINES
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821

MINES (EXCAVATIONS)
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826

MINICOMPUTERS
Development of a method to detect geologic faults and other linear features from LANDSAT images
[PB80-189665] N80-32844

MINING
A methodology for the environmental assessment of advanced coal extraction systems
[NASA-CR-163570] N80-32827

MIRRORS
Studies in tandem mirror theory
[UCRL-83519-REV-1] N80-33234
Nonlinear ion-cyclotron waves in mirror machines
[UCRL-83517] N80-33236
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518-REV-1] N80-33250

MISALIGNMENT
Psychophysical criteria for visual simulation systems. Phase 2: Experimental investigations of display joints and scene inserts
[AD-A088316] N80-33091

MISS DISTANCE
Guidance and control of tactical missiles
[AD-A085147] N80-32422

MISSILE CONTROL
Guidance and control of tactical missiles
[AD-A085147] N80-32422
Advanced pattern-matching techniques for autonomous acquisition
[AD-A087684] N80-33212

MISSILE RANGES
Universal documentation system handbook. Volume 3: Program support plan and operations directive
[AD-A088222] N80-32415

MISSILES
Guidance and control of tactical missiles
[AD-A085147] N80-32422

MISSION PLANNING
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363
Potential problems relative to TDRS/IUS tilt table elevation with failed URCS
[NASA-TM-82201] N80-32411
Titan probe technology assessment and technology development plan study
[NASA-CR-152381] N80-32417
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424
User's guide for the Flight Design System (FDS)
[NASA-TM-82202] N80-32426
STS-1 operational flight profile. Volume 1: Ground rules and constraints cycle 3.1.1
[NASA-TM-82200] N80-32427

MISSIONS
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

MISSISSIPPI
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826

MISSOURI
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

MIXING CIRCUITS
A monolithic GaAs IF amplifier for integrated receiver applications
[AD-A088298] N80-32670

MIXTURES
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32800

MODAL RESPONSE
Dynamic modal estimation using instrumental variables
[NASA-CR-152396] N80-32777

MODELS
Development of software for computer assisted model simplification
[DOE/EIA-10597/T1] N80-33112

MODULATION
Investigation of photographic image quality estimators
[AD-A087805] N80-32702

MOISTURE CONTENT
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plains Corridor, US
[E80-10328] N80-32819
Relation between west coastal rainfall and Nimbus 6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054

MOLECULAR BEAMS
Chemical reactions on solid surfaces using molecular beam techniques
[AD-A088447] N80-33266

MOLECULAR ENERGY LEVELS
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A088118] N80-32457

MOLECULAR EXCITATION
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032

MOLECULAR IONS
Ion chemistry in interstellar space
[NASA-CR-160580] N80-33188
A study of secondary ion triple bond analogues
[AD-A088423] N80-33262

MOLECULAR ROTATION
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275

MOLECULAR SPECTROSCOPY
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455

MOLECULAR STRUCTURE
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254

MOLECULES
Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-580-VOL-45-NO-5] N80-33251

MOLTEN SALT NUCLEAR REACTORS
Tandem mirror fusion-fission hybrid studies
[UCRL-84018] N80-33237

MOLTEN SALTS
Design and operation of thermal convection loops for corrosion testing in molten NaNO3-KNO3 --- solar-thermal conversion
[SAND-80-8212] N80-32501

MONOPOLE ANTENNAS
Analysis of a finite length tubular monopole antenna driven by a coaxial line
[SAND-79-1557] N80-32647
Admittance of an infinitely long monopole antenna, immersed in a dissipative medium and driven by an airfilled coaxial line
[SAND-79-1401] N80-32648

MONOTONE FUNCTIONS
On the first passage time distribution for a class of Markov chains
[AD-A088111] N80-33159

MONSOONS
The monsoon experiment MONEX
[NASA-CR-163509] N80-33046

MONTE CARLO METHOD
Some Bayes estimators of reliability for the inverse Gaussian lifetime model
[AD-A088078] N80-33158
Formulas for a two-sample Monte Carlo swindle
[AD-A088072] N80-33160
A robust confidence interval for samples of five observations
[AD-A088071] N80-33161
Fusion product deposition and energy balance
[UCID-19710] N80-33204

MORPHOLOGY
Mechanical properties versus morphology of ordered polymers
[AD-A087927] N80-32520

MOTORS
Redundant motor drive system
[NASA-CASE-MFS-23777-1] N80-32716

MOVING TARGET INDICATORS
Interferometric locating system
[NASA-CASE-NPO-14173-1] N80-32359
An analysis of foliage effects on long-range surveillance
[AD-A088163] N80-32643
Integrated circuit design of a video reconstructor for a range-gated moving target indicator
[AD-A084376] N80-32661

MULTICHANNEL COMMUNICATION
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047

MULTIMISSION MODULAR SPACECRAFT
Solar Maximum Mission
[NASA-TM-82192] N80-33327

MULTIPATH TRANSMISSION
Multipath propagation over snow at millimeter wavelengths
[AD-A087747] N80-32618

MULTIPHASE FLOW
Centrifugal pump performance under simulated two-phase flow conditions
[CONF-800804-7] N80-32727

MULTIPLEXING
Applications of advanced electric/electronic technology to conventional aircraft
[NASA-CR-163576] N80-32375

MULTIPROCESSING (COMPUTERS)
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32908

MULTISPECTRAL BAND SCANNERS
High resolution infrared radiation sounder/model 2 (HIRS/2)
[NASA-CR-160030] N80-33055
Multispectral scanner optical system
[NASA-CASE-MSC-18255-1] N80-33210

MULTISPECTRAL PHOTOGRAPHY
The applicability of remote sensing to Earth biological problems. Part 2: The potential of remote sensing in pest management
[NASA-CR-163589] N80-32830

MULTIVARIATE STATISTICAL ANALYSIS
Confidence intervals on nonnegative linear combinations of variances
[AD-A084194] N80-33151

N

N-TYPE SEMICONDUCTORS
Hydrogen production by photoelectrolytic decomposition of H2O using solar energy
[NASA-CR-163586] N80-32854

NACELLES
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397

NAPHTHENES
Evaluation of alternative insulating oils for use in transformers and other electrical apparatus: Characteristics of insulating oils for electrical application
[EPRI-EL-809-SY] N80-32680

NASA PROGRAMS
FY 1981 budget press briefing
[NASA-TM-82195] N80-33308

Department of Housing and Urban Development - independent agencies appropriations for 1981. Part 4: National Aeronautics and Space Administration
[GPO-57-198] N80-33310
NASA authorization for fiscal year 1979, part 1
[GPO-25-603] N80-33311

NATURAL GAS
International energy indicators
[DOE/IA-0010] N80-32918

NATURAL LANGUAGE (COMPUTERS)
Microcomputer-based natural-language understanding, phase 1
[PB80-187370] N80-33116

NAVIGATION AIDS
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391
Horizontal datums for nautical charts
[AD-A088340] N80-32839

NAVIGATION TECHNOLOGY SATELLITES
GPS NAVSTAR-4 and NTS-2 long term frequency stability and time transfer analysis
[AD-A088092] N80-32370

NAVSTAR SATELLITES
GPS NAVSTAR-4 and NTS-2 long term frequency stability and time transfer analysis
[AD-A088092] N80-32370

NEAR FIELDS
Diffraction of a Cassegrain antenna subreflector
[INPE-1827-RPE/193] N80-32613

NEBRASKA
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843

NETHERLANDS
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

NETWORK ANALYSIS
Near-equivalence of network flow algorithms
[AD-A088032] N80-33132

NETWORK SYNTHESIS
Invertible binary matrices — techniques in digital network synthesis
[AD-A085575] N80-33128
Near-equivalence of network flow algorithms
[AD-A088032] N80-33132

NEUTRAL BEAMS
New concept for a high-power beam dump
[UCRL-83696] N80-33208

NEUTRINOS
Heavy weak bosons, cosmic antimatter and DUMAND. 2: Looking for cosmic antimatter with DUMAND
[NASA-TM-82017] N80-33333

NEUTRON COUNTERS
CR-39 polymer, a promising new solid state track recorder for high energy neutron applications
[HEDL-SA-2149] N80-32531

NEUTRON CROSS SECTIONS
Fusion materials high energy-neutron studies
[HEDL-SA-2145-FP] N80-33207

NEUTRON IRRADIATION
Neutron irradiation effects on fatigue crack propagation in type 316 stainless steels at 649 deg C
[AD-A088052] N80-32493
Microstructure and tensile properties of heavily irradiated 5052-0 aluminum alloy
[CONF-800809-3] N80-32511
CR-39 polymer, a promising new solid state track recorder for high energy neutron applications
[HEDL-SA-2149] N80-32531
Fusion materials high energy-neutron studies
[HEDL-SA-2145-FP] N80-33207
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278

NEUTRON STARS
Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317

NEW ENGLAND (US)
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-32980

NEW HAMPSHIRE
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

NEW MEXICO
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977

NEWTON THEORY
Research in nonlinear structural and solid mechanics
[NASA-CP-2147] N80-32756
Newton's method: A link between continuous and discrete solutions of nonlinear problems N80-32759

NEWTON-RAPHSON METHOD
Self-adaptive incremental Newton-Raphson algorithms N80-32764

NICKEL ALLOYS
Study of grain boundary segregation using the Auger electron emission technique
[DOE/ER-02166] N80-33280

NICKEL CADMIUM BATTERIES
Nickel cadmium batteries. Citations from the NTIS data base
[PB80-812340] N80-32956

NICKEL COMPOUNDS
Chemical, spectral, structural, and charge transport properties of the molecular metals produced by ionization of nickel phtalocyanine
[AD-A087553] N80-32449

NIGHTGLOW
Plasma irregularities in the tropical F-region detected by OI 7774 A and 6300 A nightglow measurements
[INPE-1844-RPE/204] N80-33026
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031

NIOBIUM COMPOUNDS
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278

NIOBIUM STANNIDES
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507

NITRATES
The syntheses of nitrate and nitrite selective polymers
[PB80-195076] N80-32532

NITRIC OXIDE
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-14] N80-32475
Two-photon excitation of nitric oxide fluorescence as a temperature indicator in unsteady gas-dynamic processes
[NASA-TM-81220] N80-32700

NITRITES
The syntheses of nitrate and nitrite selective polymers
[PB80-195076] N80-32532

NITROGEN
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209

NITROGEN OXIDES
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265

NITROGEN POLYMERS
The syntheses of nitrate and nitrite selective polymers
[PB80-195076] N80-32532

NITROMETHANE
Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

NOAA 6 SATELLITE
APT 80-1 technical notes
[INPE-1845-NTE/162] N80-32419

NOCTURNAL VARIATIONS
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032

NOISE GENERATORS
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177

NOISE MEASUREMENT
A new theory for rapid calculation of the ground pattern of the incident sound intensity produced by a maneuvering jet airplane
[NASA-TP-1733] N80-32334
Experimental studies of impulsive noise produced by spheres moving through water
[AD-A084419] N80-33179
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182
Study of lateral excess sound attenuation as determined from far part 36 aircraft noise certification measurements
[AD-A088285] N80-33183
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184

NOISE POLLUTION
A new theory for rapid calculation of the ground pattern of the incident sound intensity produced by a maneuvering jet airplane
[NASA-TP-1733] N80-32334

NOISE PREDICTION (AIRCRAFT)
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182

NOISE PROPAGATION
Study of lateral excess sound attenuation as determined from far part 36 aircraft noise certification measurements
[AD-A088285] N80-33183

NOISE REDUCTION
Multiple pure tone elimination strut assembly
[NASA-CASE-FRC-11062-1] N80-32393
Support assembly for cryogenically coolable low-noise choke waveguide
[NASA-CASE-NPO-14253-1] N80-32605
Noise suppression methods for robust speech processing
[AD-A085667] N80-32629
Airframe noise reduction studies and clean-airframe noise investigation
[NASA-CR-159311] N80-33175

NOISE THRESHOLD
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

NONDESTRUCTIVE TESTS
Flaw detection and evaluation of composite cylinders using laser speckle interferometry and holography
[AD-A088206] N80-32447
Liquid surface levitation holography. Part 1: Theoretical
[AD-A088418] N80-32703
A high-sensitivity potential-drop technique for fatigue crack growth measurements
[AD-A088278] N80-32782

Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171
Nondestructive evaluation of Si wafers using SAW
[AD-A084665] N80-33260

NONFLAMMABLE MATERIALS
Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406

NONLINEAR EQUATIONS
Iterative methods based upon residual averaging
N80-32762
Study of solution procedures for nonlinear structural equations N80-32765

NONLINEAR PROGRAMMING
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127

NONLINEAR SYSTEMS
PRANC: Program for analyzing nonlinear circuits
[AD-A088422] N80-32666
Research in nonlinear structural and solid mechanics
[NASA-CP-2147] N80-32756
Newton's method: A link between continuous and discrete solutions of nonlinear problems N80-32759
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
Computational strategy for the solution of large strain nonlinear problems using the Wilkins explicit finite-difference approach N80-32763
Approximation of finite element nodal point stresses for nonlinear material models
[K/TS-3798] N80-32791
Identification of nonlinear delay systems using spline methods
[AD-A088251] N80-33134
Signal processing aspects of nonlinear acoustics
[AD-A088369] N80-33181

NONLINEARITY
Post-buckling behavior of a beam-column on a nonlinear elastic foundation with a gap N80-32767
A proposed generalized constitutive equation for nonlinear para-isotropic materials N80-32769
Nonlinear finite element analysis: An alternative formulation N80-32774
Corotational velocity strain formulations for nonlinear analysis of beams and axisymmetric shells
N80-32775
Analysis of nonlinear stochastic systems with wide-band inputs
[AD-A088243] N80-33154

NONPARAMETRIC STATISTICS
Nonparametric empirical Bayes estimation of reliability
[AD-A088182] N80-32742

NORMAL DENSITY FUNCTIONS
Some graphical considerations in time series analysis
[AD-A088246] N80-33131
A robust estimator of the difference between location parameters of correlated variables for fragmentary samples
[AD-A088109] N80-33162

NORTH AMERICA
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809

NORTH CAROLINA
The State Science, Engineering and Technology program in North Carolina, study phase
[PB80-190846] N80-33307

NORTH DAKOTA
Applying scientific and technological resources for North Dakota policy development: State Science, Engineering and Technology program
[PB80-189624] N80-33306

NORTH SEA
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820

NOTCH TESTS
Fracture toughness of brittle materials determined with chevron notch specimens
[NASA-TM-81607] N80-32486
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787

NOZZLE DESIGN
Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N80-32392

NOZZLE FLOW
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397

NOZZLES
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32399

NUCLEAR ELECTRIC POWER GENERATION
Tandem mirror fusion-fission hybrid studies
[UCRL-84018] N80-33237

NUCLEAR FISSION
Tandem mirror fusion-fission hybrid studies
[UCRL-84018] N80-33237

NUCLEAR FUSION
Energy and technology review
[UCRL-52000-80-6] N80-32909
Inertial confinement fusion systems using heavy ion accelerators as drivers
[SLAC-PUB-2490] N80-33201
Fusion product deposition and energy balance
[UCID-18710] N80-33204
Fusion materials high energy-neutron studies
[HEDL-SA-2145-FP] N80-33207
New concept for a high-power beam dump
[UCRL-83696] N80-33208
Tandem mirror fusion-fission hybrid studies
[UCRL-84018] N80-33237
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518-REV-1] N80-33250

NUCLEAR MAGNETIC RESONANCE
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549
Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32568

NUCLEAR REACTIONS
Recent developments in nuclear reaction theories and calculations
[UCRL-84369] N80-33202

NUCLEAR REACTORS
Tandem mirror reactors with thermal barriers
[UCRL-83505] N80-33244

NUCLEAR RESEARCH
Forecasts of energy technology. Citations from the International Aerospace Abstracts data base
[NASA-CR-163596] N80-32965

NUCLEATION
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024

NUMERICAL ANALYSIS
Nonlinear finite element analysis: An alternative formulation N80-32774
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127
Numerical regularization of ill-posed problems
[AD-A088073] N80-33138
Numerical modelling of an end-plugged theta pinch
[MSNW-80-1146-2] N80-33231

NUMERICAL CONTROL
A minimum excursion-time control system
[AD-A087774] N80-33096

NUMERICAL FLOW VISUALIZATION
Computational and simplified analytical treatment of transonic wing-fuselage-pylon-store interactions
[AD-A085619] N80-32383

NUMERICAL INTEGRATION
Analytic approaches to unstable resonators
[AD-A088378] N80-32664
Boundary integral equation method for fracture problems with mixed mode deformations
[ORNL/CSD-57] N80-33146

NUMERICAL STABILITY
The mechanism of a detonation wave enhancement in a two-phase combustible medium
[TAE-333] N80-32687

NUTS (FRUITS)
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815

O

OCEAN CURRENTS
Electromagnetic fields induced by ocean currents
[AD-A085727] N80-32627
On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088082] N80-33076
The Gulf Stream Meanders experiment: Current meter, atmospheric, and sea level data report for the mooring period
[AD-A088069] N80-33077

OCEAN DATA ACQUISITIONS SYSTEMS
The Gulf Stream Meanders experiment: Current meter, atmospheric, and sea level data report for the mooring period
[AD-A088069] N80-33077
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295

OCEAN SURFACE
Seasat-A land applications data processing plan
[E80-10317] N80-32810
On extracting brightness temperature maps from scanning radiometer data --- techniques for algorithm design
[NASA-TM-81989] N80-32838
Solitons and the inverse scattering transform
[AD-A088023] N80-33141

OCEAN THERMAL ENERGY CONVERSION
Proceedings of the Ocean Energy Information Dissemination Workshop
[SERI/TP-732-600] N80-32956

OCEANOGRAPHY
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075

OCEANS
Passive 19.3 GHz radiometer and aerosol data from the North Sea during MARSEN I, September - October 1979
[AD-A088229] N80-33068

OHMIC DISSIPATION
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
Reversed-field pinch fusion reactor
[LA-UR-80-1494] N80-33246
Initial reversed-field pinch experiments on ZT-40 and recent advances in RFP theory
[LA-UR-80-1834] N80-33248
Initial study of ballistic effects for the operation of GaAs FET devices
[AD-A088350] N80-33270

OIL EXPLORATION
International energy indicators
[DOE/IA-0010] N80-32918

OIL FIELDS
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566

OIL POLLUTION
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820
Performance tests of high speed ZRV oil skimmer
[AD-A088062] N80-32971

OILS
Evaluation of alternative insulating oils for use in transformers and other electrical apparatus: Characteristics of insulating oils for electrical application
[EPRI-EL-809-SY] N80-32680

OMEGA NAVIGATION SYSTEM
Initial data bank report: Fall 1978; winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372
System description for the Airborne-Omega Data Bank
[AD-A087606] N80-32373
ONBOARD EQUIPMENT
Automatic test equipment
[AD-A088177] N80-32408
Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429
OPACITY
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007
OPERATING SYSTEMS (COMPUTERS)
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32808
As-built design specification for a list processing system
[E80-10325] N80-32816
Security and privacy in the 80's
[RAND/P-6492] N80-33291
OPERATIONS RESEARCH
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326
The effect of the Western Union Weather Data System on the preflight briefing position at the Chicago Flight Service Station
[AD-A088415] N80-33065
Deciding on the best (in this case) approach to time-series forecasting
[CONF-800571-1] N80-33165
A generalized decision support system using predicate calculus and network data base management
[AD-A088079] N80-33166
Basic Research in Engineering: Process and Systems Dynamics and Control. High Priority Research Needs Relevant to Energy
[FE-2468-65] N80-33167
OPTICAL DATA PROCESSING
Multibeam single frequency synthetic aperture radar processor for imaging separate range swaths
[NASA-CASE-NPO-14525-2] N80-32607
SlideStore large capacity information storage
[PB80-187875] N80-33103
OPTICAL EMISSION SPECTROSCOPY
Crystal growth by skull melting
[AD-A088013] N80-33269
OPTICAL EQUIPMENT
Advanced very high resolution radiometer, Mod 2 engineering report
[NASA-CR-160034] N80-32701
OPTICAL MEASURING INSTRUMENTS
Application of a photodiode-array optical turbulence sensor to wind studies in complex terrain
[UCRL-84503] N80-33074
Design and implementation of a fiber-optic gamma-measurement system
[UCRL-84109] N80-33219
OPTICAL MEMORY (DATA STORAGE)
SlideStore large capacity information storage
[PB80-187875] N80-33103
OPTICAL PROPERTIES
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214
Optical and mechanical properties of infrared materials
[AD-A088120] N80-33216
Optical coatings for laser fusion applications
[UCRL-83582] N80-33238
OPTICAL RADAR
Mesopheric winds from lidar observations of atmospheric sodium
[INPE-1811-RPE/179] N80-33051
Windfield retrieval from Doppler lidar observations
[NASA-CR-161572] N80-33123
OPTICAL WAVEGUIDES
Basic research in electronics, JSEP
[AD-A088121] N80-32672
OPTICS
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628
Fundamentals and techniques of nonimaging optics for solar energy concentration
[DOE/ER-04657/2] N80-32896
OPTIMIZATION
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460
Optimal strategies for second guessers
[AD-A087897] N80-33124
ORBIT TRANSFER VEHICLES
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Orbit transfer vehicle engine study. Volume 3: Program costs
[NASA-CR-161574] N80-32433
ORBITAL ASSEMBLY
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies — rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861
ORBITAL POSITION ESTIMATION
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363
ORCHARDS
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
ORDER-DISORDER TRANSFORMATIONS
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254
OREGON
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063
ORGANIC COMPOUNDS
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987
ORGANOMETALLIC COMPOUNDS
Electrically conductive macromolecules via cofacial assembly techniques
[AD-A087554] N80-32519
ORIFICE FLOW
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389
ORTHOGONALITY
Computations of the radiation pattern of a reflector antenna
[AD-A088273] N80-32633
ORTHOSTATIC TOLERANCE
The development of an elastic reverse gradient garment to be used as a countermeasure for cardiovascular deconditioning
[NASA-CR-152379] N80-33086
ORTHOTROPISM
Stability optimization of laminated composite plates
[ISAS-579-VOL-45-NO-4] N80-32442
OSEEN APPROXIMATION
A procedure for calculation of the pressure along the axis of a tip vortex
[AD-A087667] N80-32343
OSMOSIS
Multielement analysis of water through osmotic reduction and X-rays
[PB80-216690] N80-32482
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524
OTTO CYCLE
Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733
OUTGASSING
Nuclear waste management
[PNL-3000-4] N80-33203
OXIDATION
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Coal combustion by wet oxidation. Wet oxidation of coal for energy production: Test plan and partial results
[DOE/ET-12328/T1] N80-32474
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-14] N80-32475
Initial stages of oxidation of metals and alloys
[DOE/ER-10501/1] N80-32500
Oxidative stabilization of acrylic fibers. Part 5: The decoloration reaction
[AD-A088299] N80-32523
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000
OXIDES
Structure of high angle grain boundaries in metals and ceramic oxides
[DOE/ER-05002/9] N80-32510
OXYGEN
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878
OZONE
Curable liquid hydrocarbon prepolymers containing hydroxyl groups and process for producing same
[NASA-CASE-NPO-13137-1] N80-32514
NASA Global Atmospheric Sampling Program (GASP) data report for tape VL0014
[NASA-TM-81579] N80-32970
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045
OZONOMETRY
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149

P

P-TYPE SEMICONDUCTORS
Hydrogen production by photoelectrolytic decomposition of H2O using solar energy
[NASA-CR-163586] N80-32854
Electronic processes in InP and related compounds
[AD-A088446] N80-33263
PACIFIC OCEAN
A quantitative analysis of inter-island telephony traffic in the Pacific Basin Region (PBR)
[NASA-TM-81587] N80-32610
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054
PAIR PRODUCTION
Interatomic forces in solid and liquid transition metals
[AD-A087672] N80-32492
PAKISTAN
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions — Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Fuego volcanoes, Guatemala
[E80-10312] N80-32807
PALEONTOLOGY
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-32846

Paleontological resources evaluation: Red Fleet Reservoir
[PB80-204256] N80-32647

PAPER (MATERIAL)
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

PARABOLIC ANTENNAS
A parabolic cyclinder reflector system with low sidelobes: Experimental results
[AD-A088202] N80-32639

PARABOLIC REFLECTORS
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
Parabolic trough solar collector wind loading
[SAND-79-2134C] N80-32895
The 3X Compound Parabolic Concentrating (CPC) solar energy collector
[DOE/CS-04239/T1] N80-32944

PARACHUTES
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32336

PARAFFINS
Evaluation of alternative insulating oils for use in transformers and other electrical apparatus: Characteristics of insulating oils for electrical application
[EPRI-EL-809-SY] N80-32680
Characteristics of insulating oil for electrical application
[EPRI-EL-1300] N80-32681

PARAMETER IDENTIFICATION
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
Parameter estimation techniques for nonlinear distributed parameter systems
[AD-A088244] N80-33153
Total gamma absorption telescope with multiparametric analysis
[INPE-1804-RPE/172] N80-33321

PARITY
Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01388-444] N80-33193

PARTIAL DIFFERENTIAL EQUATIONS
Iterative methods based upon residual averaging
N80-32762
Semistable laws on topological vector spaces
[AD-A088224] N80-33143
Parameter estimation techniques for nonlinear distributed parameter systems
[AD-A088244] N80-33153
Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171

PARTICLE ACCELERATORS
Inertial confinement fusion systems using heavy ion accelerators as drivers
[SLAC-PUB-2490] N80-33201

PARTICLE BEAMS
Proceedings of the Particle Beam Research Workshop
[AD-A085158] N80-33196

PARTICLE COLLISIONS
Electromagnetic instabilities in collisionless plasmas
[UCRL-TRANS-11593] N80-33240

PARTICLE DIFFUSION
Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243

PARTICLE INTERACTIONS
Interaction of radiation with matter.
[DOE/EV-02386/1] N80-32436
Interactions between small polaronic particles in solids
[SAND-80-0486C] N80-33194

PARTICLE SIZE DISTRIBUTION
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007
Effective sampling techniques for particulate emissions from atypical stationary sources
[PB80-185549] N80-33010

PARTICLE TRACKS
CR-39 polymer, a promising new solid state track recorder for high energy neutron applications
[HEDL-SA-2149] N80-32531

PARTICLES
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570

PARTICULATE SAMPLING
Sampling and analysis of reduced and oxidized species in process streams
[PB80-191281] N80-32994
Effective sampling techniques for particulate emissions from atypical stationary sources
[PB80-185549] N80-33010
Proceedings: Advances in Particle Sampling and Measurement
[PB80-187487] N80-33014

PATHOLOGICAL EFFECTS
Evaluation of carbon monoxide in blood samples from the second national health and nutrition survey
[COO-4552-2] N80-33069
Studies on the removal of carbon monoxide from the atmosphere at ambient temperture — submarine atmospheres
[AD-A085469] N80-33088

PATTERN RECOGNITION
Operation plan for the High Density Tape/LANDSAT Imagery Verification and Extraction System (HDT/LIVES) data processing support
[E80-10322] N80-32813
As-built design specification for CCITS processor program
[E80-10323] N80-32814
As-built design specification for a list processing system
[E80-10325] N80-32816
On extracting brightness temperature maps from scanning radiometer data — techniques for algorithm design
[NASA-TM-81989] N80-32838
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840
Development of a method to detect geologic faults and other linear features from LANDSAT images
[PB80-189665] N80-32844
Advanced pattern-matching techniques for autonomous acquisition
[AD-A087684] N80-33212

PAVEMENTS
Permanent deformation of flexible pavements
[AD-A087859] N80-32588
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32590
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32500
Pavement and geometric design criteria for minimizing hydroplaning. A technical summary
[PB80-190457] N80-32603

PAYLOAD DELIVERY (STS)
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319

PDP COMPUTERS
Metrology data reduction system: PDP-11/34 computer system
[BDX-613-2402] N80-32599

PERCOLATION
Percolation and electrical conduction in superconducting composites
[AD-A088196] N80-33271

PERFORMANCE PREDICTION
Helicopter dynamic performance program. Volume 2: User's manual
[AD-A088318] N80-32387
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
Modeling and evaluation of designs for solid hydrogen storage beds
[CONF-800616-8] N80-32554
Potential of spark ignition engine, 1979 summary source document
[PB80-191034] N80-32737
Human performance in continuous operations. Volume 3: Technical documentation
[AD-A086339] N80-33092

PERFORMANCE TESTS
Performance deterioration of commercial high bypass ratio turbofan engines
[NASA-TM-81552-REV] N80-32394
Research on graphite reinforced glass matrix composites
[NASA-CR-159312] N80-32440
Upgraded automotive gas turbine engine design and development program, volume 2
[NASA-CR-159671] N80-32719
UTRC 8 kW wind turbine tests
[RFP-3085] N80-32722

PERIHELIONS
Interference filter photometry of periodic comet Ashbrook-Jackson
[NASA-CR-163581] N80-33318

PERIODIC VARIATIONS
Earth's rotation in 1975-1979 based on Doppler satellite observations
[AD-A088095] N80-32804
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328

PERMEABILITY
Calculation of the Biot-Savart law magnetic field using current distributions obtained from a finite element analysis
[AD-A088094] N80-33172

PERSONNEL DEVELOPMENT
Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305

PERTURBATION THEORY
Electromagnetic instabilities in collisionless plasmas
[UCRL-TRANS-11593] N80-33240

PERU
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547

PETROLEUM PRODUCTS
Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575

PHASED ARRAYS
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 1: Basic EIS appendices
[AD-A088320] N80-32644

PHENOLIC RESINS
Determination of kinetic parameters for thermal decomposition of phenolic ablative materials by multiple heating rate method
[AD-A087929] N80-32443

PHENOLOGY
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Using LANDSAT digital data for estimating green biomass — Throckmorton, Texas test site and Great Plains Corridor, US
[E80-10328] N80-32819

PHOSPHORIC ACID
Development of an energy consumption and cost data base for fuel cell total energy systems and conventional building energy systems
[ORNL/CON-38] N80-32960

PHOSPHORS
Phosphor-penetration color cathode-ray tube
[AD-A088518] N80-32665

PHOSPHORUS
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
Phosphorous control strategies at municipal wastewater treatment plants in the US Great Lakes Basin
[PB80-191059] N80-32998

PHOTOCHEMICAL REACTIONS
Luminescent tellurium-doped cadmium sulfide electrodes as probes of semiconductor excited-state deactivation processes in photoelectrochemical cells
[AD-A088532] N80-32451
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009
Structure and function in photosynthetic membranes and their components
[COO-3162-51] N80-33078
Light induced electron transfer reactions of metal complexes
[BNL-28043] N80-33277

PHOTODIODES
Application of a photodiode-array optical turbulence sensor to wind studies in complex terrain
[UCRL-84503] N80-33074
European fiber optics. USAF laboratory experts visit
[AD-A088209] N80-33217
Electronic process in InP and related compounds
[AD-A084260] N80-33261

PHOTOELASTIC ANALYSIS
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748

PHOTOELASTICITY
Dynamic mixed mode fracture --- stress intensity factors
[AD-A088287] N80-32784

PHOTOELECTRIC CELLS
Luminescent tellurium-doped cadmium sulfide electrodes as probes of semiconductor excited-state deactivation processes in photoelectrochemical cells
[AD-A088532] N80-32451

PHOTOELECTRIC EMISSION
Electronic process in InP and related compounds
[AD-A084260] N80-33261

PHOTOELECTRIC GENERATORS
Potential for supplying solar thermal energy to industrial unit operations
[SERI/TP-632-584] N80-32911
The 3X Compound Parabolic Concentrating (CPC) solar energy collector
[DOE/CS-04239/T1] N80-32944

PHOTOELECTRIC MATERIALS
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876

PHOTOGEOLOGY
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
Development of a method to detect geologic faults and other linear features from LANDSAT images
[PB80-189665] N80-32844

PHOTOINTERPRETATION
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
The application of remote sensing to resource management and environmental quality programs in Kansas --- kahsas; roy's and phony creeks watersheds; the proposed taligrass prairie national park and pin ford lake, missouri.
[E80-10337] N80-32825
Development of a method to detect geologic faults and other linear features from LANDSAT images
[PB80-189665] N80-32844

PHOTOIONIZATION
Photoionization of atoms
[COO-2892-18] N80-33192

PHOTOLITHOGRAPHY
Semiconductor measurement technology
[AD-A088262] N80-32668

PHOTOMAPPING
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
Characterization of Cerrado vegetation using automatically classified LANDSAT MSS data
[INPE-1790-RPE/162] N80-32835

PHOTOMETERS
European fiber optics. USAF laboratory experts visit
[AD-A088209] N80-33217

PHOTOMETRY
Interference filter photometry of periodic comet Ashbrook-Jackson
[NASA-CR-163581] N80-33318

PHOTOPLASTICITY
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787

PHOTOSTRESSES
The effect of designated pollutants on plant species
[AD-A078933] N80-32969

PHOTOSYNTHESIS
Structure and function in photosynthetic membranes and their components
[COO-3162-51] N80-33078

PHOTOVOLTAIC CELLS
Improving the efficiency of silicon solar cells containing chromium
[NASA-CASE-NPO-15179-1] N80-32850
Operation and maintenance cost data for residential photovoltaic modules/panels
[NASA-CR-163585] N80-32855
Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874
Analysis of a passive heat pipe cooled solar photovoltaic receiver
[SAND-80-7011] N80-32885
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914
Photovoltaic mechanisms in polycrystalline thin-film silicon solar cells
[DOE/ET-23108/2] N80-32923
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927
Cuprous oxide photovoltaic cells
[DOE/ET-23010/17] N80-32932
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935
Simple economic evaluation and applications experiments for photovoltaic systems for remote sites
[SAND-80-0749C] N80-32937
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-79-2270C] N80-32938

PHOTOVOLTAIC CONVERSION
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 2: Technical results
[SAND-79-7018/2-VOL-2] N80-32870

PHTHALOCYANIN
Chemical, spectral, structural, and charge transport properties of the molecular metals produced by ionization of nickel phtalocyanine
[AD-A087553] N80-32449

PHYSIOLOGICAL TESTS
Cardiopulmonary data acquisition system. Version 2.0, volume 1: User's guide
[NASA-CR-160608] N80-33083

PIEZOELECTRIC CRYSTALS
Acceleration sensitivity compensation of crystal resonators
[AD-A085683] N80-32662

PIEZOELECTRIC TRANSDUCERS
Scattering matrix analysis of surface acoustic wave reflections and transducers
[AD-A085764] N80-33180

PILOT PERFORMANCE
Preliminary evaluation of time and distance spacing cues using a cockpit displayed target
[NASA-TM-81794] N80-32362

PILOT PLANTS
Coal demonstration plants
[DOE/FE-0004/79-2] N80-32555
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572
Coal liquefaction
[DOE/FE-0003/79-2] N80-32574
Open-cycle MHD systems analysis
[EPRI-AP-1316] N80-32881
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977

PIONEER VENUS SPACECRAFT
Surface of Venus from Pioneer
[NASA-TM-82193] N80-33324

PIPE FLOW
Modal content of noise generated by a coaxial jet in a pipe
[NASA-CR-163575] N80-33177

PIPES (TUBES)
Fracture toughness testing of HDPE plastic pipe
[MIT-CE-R79-5] N80-32751

PITCH (INCLINATION)
Transonic pitch damping of a delta wing aircraft determined from flight measurements
[AD-A087771] N80-32381

PLANE WAVES
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1762-RPE/151] N80-33253

PLANETARY STRUCTURE
Surface of Venus from Pioneer
[NASA-TM-82193] N80-33324

PLANT STRESS
The effect of designated pollutants on plant species
[AD-A078933] N80-32969

PLANTS (BOTANY)
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

PLASMA CONTROL
Plasma confinement experiments in the TMX tandem mirror
[UCRL-83515] N80-33241

PLASMA DENSITY
Fusion product deposition and energy balance
[UCID-18710] N80-33204

PLASMA DIAGNOSTICS
Plasma diagnostics using photon-induced charge transfer
[AD-A088228] N80-33229

PLASMA DIFFUSION
Kinetic-theory description of electron heat transfer in a plasma
[MSNW-801146-1] N80-33232
PLASMA DYNAMICS
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
PLASMA FLUX MEASUREMENTS
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243
PLASMA GUNS
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
Nonlinear ion-cyclotron waves in mirror machines
[UCRL-83517] N80-33236
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518-REV-1] N80-33250
PLASMA HEATING
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
Tokamak heating and current maintenance with intense pulsed ion beams
[AD-A088274] N80-33230
PLASMA INTERACTIONS
Interaction of radiation with matter.
[DOE/EV-02386/1] N80-32436
PLASMA PHYSICS
Plasma theory and simulation
[AD-A088331] N80-33224
Kinetic-theory description of electron heat transfer in a plasma
[MSNW-801146-1] N80-33232
Studies in tandem mirror theory
[UCRL-83519-REV-1] N80-33234
Nonlinear ion-cyclotron waves in mirror machines
[UCRL-83517] N80-33236
Large aspect ratio Tokamak study
[ORNL/TM-7278] N80-33239
Tandem mirror reactors with thermal barriers
[UCRL-83505] N80-33244
Compact torus experiments and theory
[LA-UR-80-1826] N80-33249
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518-REV-1] N80-33250
PLASMA PINCH
A diverted plasma reversed field pinch
[AD-A088049] N80-33225
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518-REV-1] N80-33250
PLASMA SHEATHS
A computer model of solar panel-plasma interactions
[NASA-CR-160796] N80-32853
PLASMA SPECTRA
Development of a temporally and spatially resolved grazing incidence spectrometer
[UCRL-83808] N80-32464
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223
PLASMA SPRAYING
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512
PLASMA TEMPERATURE
Thermal characteristics of Discharge-heated Cooper Vapor Laser (DHCVL) heat shields formed of multiple coaxial cylinders
[UCRL-83649] N80-32714
PLASMA-ELECTROMAGNETIC INTERACTION
Influence of ion motion in the inverse Faraday effect
[INPE-1764-RPE/153] N80-33189
PLASMA-PARTICLE INTERACTIONS
A computer model of solar panel-plasma interactions
[NASA-CR-160796] N80-32853
PLASMAPAUSE
Quantitative simulation of a magnetospheric storm. 3: Plasmaspheric electric fields and evolution of the plasmapause
[NASA-CR-163455] N80-33041
PLASMAS (PHYSICS)
Quantitative simulation of a magnetospheric storm. 3: Plasmaspheric electric fields and evolution of the plasmapause
[NASA-CR-163455] N80-33041
Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227
Electromagnetic instabilities in collisionless plasmas
[UCRL-TRANS-11593] N80-33240
PLASTIC DEFORMATION
Plastic deformation of colliding hemishells
[LA-UR-80-1659] N80-32794
PLASTIC PROPERTIES
Straightening of a wavy strip: An elastic-plastic contact problem including snap-through N80-32768
A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A088375] N80-32780
Crack tip plasticity associated with corrosion assisted fatigue --- low carbon steel
[AD-A087961] N80-32783
PLASTIC TAPES
Bending behavior of lapped plastic EHV cables
[BNL-27331] N80-32789
PLASTICIZERS
Predicted performance of energetic plasticizer formulations
[AD-A087658] N80-32542
PLASTICS
Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551
On-line direct digital control extrusion process
[PB80-186489] N80-32738
PLATES (STRUCTURAL MEMBERS)
Stability optimization of laminated composite plates
[ISAS-579-VOL-45-NO-4] N80-32442
PLATES (TECTONICS)
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295
PLATING
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
PLATINUM
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505
PLOTTERS
Remote hard copy. Volume 2: Operating manual
[SAND-80-0538/2] N80-33297
PLOTTING
THOR: A post-processor for two-dimensional analysis codes
[UCRL-52852] N80-33114
The diameter of almost all bipartite graphs
[AD-A087687] N80-33125
Remote hard copy. Volume 1: Programming manual
[SAND-80-0538/1] N80-33298
PLUGGING
Numerical modelling of an end-plugged theta pinch
[MSNW-80-1146-2] N80-33231
PLUMES
Performance of simple models for stack plume dispersion during convective conditions
[PB80-191869] N80-33001
POINT DEFECTS
High angle grain boundaries as sources or sinks for point defects
[DOE/ER-05002/8] N80-33279
POINT SOURCES
Numerical solutions for steady thermal convection from a concentrated source in a porous medium
[SAND-79-2214] N80-32698
POINTS (MATHEMATICS)
Computations of the radiation pattern of a reflector antenna
[AD-A088273] N80-32633
The influence curve and goodness of fit
[AD-A085593] N80-33152
POISONING (REACTION INHIBITION)
Sulfur modifies the chemisorption of carbon monoxide on rhodium/alumina model catalysts
[AD-A088043] N80-32452
POISSON DENSITY FUNCTIONS
More on approximations of Poisson probabilities
[BNL-27878] N80-33164
POISSON EQUATION
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109
Semistable laws on topological vector spaces
[AD-A088224] N80-33143
POLAR CAP ABSORPTION
Initial data bank report: Fall 1978; winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372
POLARITY
A diverted plasma reversed field pinch
[AD-A088049] N80-33225
POLARONS
Interactions between small polaronic particles in solids
[SAND-80-0486C] N80-33194
POLICIES
Incentives for technological innovation in air pollution reduction: An ETIP (Experimental Technology Incentives Program) policy research series. Volume 2. Market mechanisms for emission regulation and enforcement of emission limits: Deterrence and demand
[PB80-186083] N80-32991
Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305
The State Science, Engineering and Technology program in North Carolina, study phase
[PB80-190846] N80-33307
POLLUTION CONTROL
High solids coating system
[AD-A088225] N80-32525
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
Potential of diesel engine, emission technology
[PB80-192685] N80-32735
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976
Inventory of emissions from non-automotive vehicular sources
[PB80-182942] N80-32990
Incentives for technological innovation in air pollution reduction: An ETIP (Experimental Technology Incentives Program) policy research series. Volume 2. Market mechanisms for emission regulation and enforcement of emission limits: Deterrence and demand
[PB80-186083] N80-32991
Economic impact of sulfur dioxide and particulate matter regulations in Illinois
[PB80-182645] N80-32992
Methodologies to conduct regulatory impact analysis of ambient air quality standards for carbon monoxide
[PB80-192461] N80-33005
Regulated and unregulated exhaust emissions from a malfunctioning three-way catalyst gasoline automobile
[PB80-187446] N80-33012
Rock filters for removal of algae from lagoon effluents
[PB80-190077] N80-33016
Regulated and unregulated exhaust emissions from malfunctioning non-catalyst and oxidation catalyst gasoline automobiles
[PB80-190473] N80-33017
Regulated and unregulated exhaust emissions from malfunctioning three-way catalyst gasoline automobiles
[PB80-190804] N80-33020
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021

POLLUTION MONITORING
Constraints on carbon dioxide production from fossil fuel use
[ORAU/IEA-80-9(M)] N80-32983
Incentives for technological innovation in air pollution reduction: An ETIP (Experimental Technology Incentives Program) policy research series. Volume 2. Market mechanisms for emission regulation and enforcement of emission limits: Deterrence and demand
[PB80-186083] N80-32991
Phosphorous control strategies at municipal wastewater treatment plants in the US Great Lakes Basin
[PB80-191059] N80-32998
Use of helium-3 as a gas tracer for meso-scale meteorological studies
[DP-MS-79-51] N80-33070
POLYATOMIC MOLECULES
Electrically conductive macromolecules via cofacial assembly techniques
[AD-A087554] N80-32519
POLYCARBONATES
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787
POLYCRYSTALS
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
POLYETHER RESINS
Predicted performance of energetic plasticizer formulations
[AD-A087658] N80-32542
POLYETHYLENES
Fracture toughness testing of HDPE plastic pipe
[MIT-CE-R79-5] N80-32751
POLYHEDRONS
Computer treatment of perspective for solids
[INPE-1785-RPE/157] N80-33105
POLYIMIDES
Toughening of thermosetting polyimides
[NASA-CR-163594] N80-32517
POLYMER PHYSICS
Structure-property relationships of linear methyl-phenyl-vinyl siloxane terpolymers
[UCRL-84303] N80-32529
POLYMERIZATION
Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-580-VOL-45-NO-5] N80-33251
POLYMERS
Microwave properties of low density (CH) sub x
[AD-A086943] N80-32518
Mechanical properties versus morphology of ordered polymers
[AD-A087927] N80-32520
CR-39 polymer, a promising new solid state track recorder for high energy neutron applications
[HEDL-SA-2149] N80-32531
POLYNOMIALS
Likelihood ratio tests for and against a stochastic ordering between multinomial populations tests for a stochastic ordering
[AD-A088194] N80-33163
POLYNUCLEAR ORGANIC COMPOUNDS
Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187388] N80-32577
POLYTOPES
How many steps?
[AD-A087860] N80-33107
POLYURETHANE RESINS
Advanced structures maintenance concepts
[AD-A087609] N80-32324
High solids coating system
[AD-A088225] N80-32525
POLYVINYL ALCOHOL
Method of cross-linking polyvinyl alcohol and other water soluble resins
[NASA-CASE-LEW-13103-1] N80-32516
PONDS
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
POROSITY
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527
POROUS MATERIALS
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444
Porous media experience applicable to field evaluation for compressed air energy storage
[PNL-3294] N80-32873
POSITION (LOCATION)
Loran-based buoy position auditing systems: Analytical evaluation
[AD-A088266] N80-32369
POSITRON ANNIHILATION
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1863-RPE/213] N80-33322
POTABLE WATER
Advanced microbial check valve development
[NASA-CR-163577] N80-33094
POTASSIUM
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834
POTENTIAL FLOW
On the theory of flow of regular water wave about a body
[AD-A084359] N80-32693
POWDERED ALUMINUM
Thermal conductivity of consolidated Al/Cu2O thermites
[MLM-2698] N80-32503
POWER AMPLIFIERS
Advanced AN/TPQ-37 transmitter tube
[AD-A088235] N80-32675
POWER EFFICIENCY
Power ratings of rf thin film resistive attenuators
[BDX-613-2404] N80-32683
POWER SPECTRA
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632
POWER SUPPLY CIRCUITS
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678
PRECIPITATION (METEOROLOGY)
Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066
PRECISION
Variable precision and interval arithmetic portable enhancements to FORTRAN
[AD-A087564] N80-33111
PREDICTION ANALYSIS TECHNIQUES
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32590
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594
The effect of compacted prestress on compacted shale compressibility
[PB80-191158] N80-32602
Potential of spark ignition engine, effect of vehicle design variables on top speed, performance, and fuel economy
[PB80-191836] N80-32736
User's manual for the vertical axis wind turbine performance computer code darter
[SAND-80-1155] N80-32872
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056
Evaluation of computing systems using functionals of a Stochastic process
[NASA-CR-163512] N80-33102
Deciding on the best (in this case) approach to time-series forecasting
[CONF-800571-1] N80-33165
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328
PREPOLYMERS
Curable liquid hydrocarbon prepolymers containing hydroxyl groups and process for producing same
[NASA-CASE-NPO-13137-1] N80-32514
Prepolymer dianhydrides
[NASA-CASE-NPO-13899-1] N80-32515
PRESSURE
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
PRESSURE DISTRIBUTION
Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332
A correlation method to predict the surface pressure distribution of an infinite plate or a body of revolution from which a jet is issuing
[NASA-CR-152345] N80-32339
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33208
PRESSURE GAGES
PUFF TOO: A residual stress experiment --- underground explosions
[SAND-79-1674] N80-32788
PRESSURE GRADIENTS
A procedure for calculation of the pressure along the axis of a tip vortex
[AD-A087667] N80-32343
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389
On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088082] N80-33076
PRESSURE REDUCTION
Engine bleed air reduction in DC-10
[NASA-CR-159846] N80-32378
PRESSURE VESSELS
Weld evaluation on spherical pressure vessels using holographic interferometry
[UCRL-84079] N80-32745
Holographic and acoustic emission of evaluation of pressure vessels
[UCRL-84046] N80-32746
PRESSURIZING
Miniplant and bench studies of pressurized fluidized-bed coal combustion
[PB80-188121] N80-32999
PRINTED CIRCUITS
Plated-through hole testing
[BDX-613-2424] N80-32800
PRIVACY
Security and privacy in the 80's
[RAND/P-6492] N80-33291

PROBABILITY DENSITY FUNCTIONS
Nonparametric Bayes estimation of distribution functions and the study of probability density estimates
[AD-A088250] N80-33156
PROBABILITY DISTRIBUTION FUNCTIONS
Nonparametric empirical Bayes estimation of reliability
[AD-A088182] N80-32742
Some Bayes estimators of reliability for the inverse Gaussian lifetime model
[AD-A088078] N80-33158
PROBABILITY THEORY
Atlas of cloud-free line-of-sight probabilities. Part 5: North Africa and the Middle East
[AD-A088156] N80-33069
Formulas for a two-sample Monte Carlo swindle
[AD-A088072] N80-33160
A robust confidence interval for samples of five observations
[AD-A088071] N80-33161
PROBLEM SOLVING
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691
Solutions of contact problems by the assumed stress hybrid model N80-32771
Near-equivalence of network flow algorithms
[AD-A088032] N80-33132
A uniqueness theorem for ordinary differential equations
[AD-A088113] N80-33137
Formulas for a two-sample Monte Carlo swindle
[AD-A088072] N80-33160
The free-body diagram revisited
[AD-A087952] N80-33173
Semiclassical Boltzmann transport theory in semiconductors
[AD-A084161] N80-33259
Future directions for decision support
[AD-A087355] N80-33289
Matching and abstraction in knowledge systems
[RAND/P-6440] N80-33293
PROCEEDINGS
Proceedings of the Ocean Energy Information Dissemination Workshop
[SERI/TP-732-600] N80-32956
PROCESS CONTROL (INDUSTRY)
Synthetic fuels from US oil shales: A technical and economic verification of the HYTORT process
[DOE/ET-14102-2] N80-32567
PRODUCT DEVELOPMENT
Development of a temporally and spatially resolved grazing incidence spectrometer
[UCRL-83808] N80-32464
Glasses and glass ceramics for sealing to aluminum alloys
[SAND-79-1405C] N80-32528
Coal liquefaction
[DOE/FE-0003/79-2] N80-32574
Advanced technology fuel cell program
[EPRI-EM-1328] N80-32877
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
A microprocessor-based cardiotachometer
[NASA-CR-160607] N80-33082
The design of a fluidic oxygen intermittent demand flow device
[AD-A084083] N80-33097
PRODUCTION ENGINEERING
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469
PRODUCTION MANAGEMENT
Orbit transfer vehicle engine study. Volume 3: Program costs
[NASA-CR-161574] N80-32433
PROGRAM VERIFICATION (COMPUTERS)
High Density Tape Reformatting System/LANDSAT Imagery Verification and Extraction System (HDTRS/LIVES) production test throughput analysis
[E80-10319] N80-32811
Distributed network protocols
[AD-A087623] N80-33117
PROGRAMMING LANGUAGES
Advanced SMITE reference manual
[AD-A087743] N80-33106
Future directions for decision support
[AD-A087355] N80-33289
PROJECT MANAGEMENT
Realistic approach to the planning of high-technology, high-risk projects
[SAND-79-1483] N80-33290
NASA authorization for fiscal year 1979, part 1
[GPO-25-603] N80-33311
PROJECT PLANNING
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-32414
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Satellite power system (SPS) concept definition study. Volume 3: Experimental verification definition
[NASA-CR-3320] N80-32860
Realistic approach to the planning of high-technology, high-risk projects
[SAND-79-1483] N80-33290
PROJECTILES
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748
Plastic deformation of colliding hemishells
[LA-UR-80-1659] N80-32794
PROPANE
Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848
PROPELLANT TRANSFER
Comparative thermal analysis of alternate Cryogenic Fluid Management Experiment (CFME) configurations
[NASA-CR-165151] N80-32412
A study on various methods of supplying propellant to an orbit insertion rocket engine
[TRW/DSSG-36358.001] N80-32413
PROPELLER BLADES
Investigation of performance, noise, and detectability characteristics of Remotely Piloted Vehicle (RPV) propellers
[AD-A088325] N80-32398
PROPELLERS
Investigation of performance, noise, and detectability characteristics of Remotely Piloted Vehicle (RPV) propellers
[AD-A088325] N80-32398
PROPULSION SYSTEM CONFIGURATIONS
Technological innovation in the design and development of the space transportation system
[NASA-TM-82190] N80-32423
PROPYLENE
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576
PROTECTIVE CLOTHING
Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406
Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586
PROTECTIVE COATINGS
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32487
PROTONS
Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549
PSYCHOMOTOR PERFORMANCE
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099
PSYCHROMETERS
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
PUBLIC HEALTH
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977
PUERTO RICO
Concentrating photovoltaic for the Tropics
[DOE/CS-04270/1] N80-32954
PULMONARY FUNCTIONS
Cardiopulmonary data acquisition system. Version 2.0, volume 2: Detailed software/hardware documentation
[NASA-CR-160609] N80-33084
PULSARS
Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317
PULSE DURATION
Rare gas halide lasers for fusion N80-32713
PULSE GENERATORS
A study of power and energy in the aurora modification project
[AD-A088051] N80-32637
Development of a 50 Hz, 250 kV, 500 ns, 500 KW average power pulse
[SAND-80-0491C] N80-32684
PULSED LASERS
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223
PUMPS
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
PURIFICATION
Advanced microbial check valve development
[NASA-CR-163577] N80-33094
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314
PYRIDINES
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Light induced electron transfer reactions of metal complexes
[BNL-28043] N80-33277
PYROLYSIS
Hydrogen exchange in some coal-related reactions at 400 C
[CONF-800610-7] N80-32463
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-16] N80-32470
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Flash pyrolysis and gasification of coal through laser heating
[LA-UR-80-1094] N80-32573

Q

QUADRUPOLES
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245

QUALITY CONTROL
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724

QUANTITATIVE ANALYSIS
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Quantitative analysis of polynuclear aromatic hydrocarbons in liquid fuels
[PB80-187388] N80-32577

QUANTUM CHEMISTRY
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191

QUANTUM MECHANICS
The quantum dynamics of chemical reactions
[AD-A084243] N80-32450

QUANTUM NUMBERS
Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01388-444] N80-33193

QUANTUM THEORY
On the analogy between mathematical problems of non-linear filtering and quantum physics
[AD-A088077] N80-33286

QUARTZ
Automated X-ray orientation for quartz crystal resonators
[AD-A088063] N80-33272

QUARTZ CRYSTALS
The effect of vibration on quartz crystal resonators
[AD-A085642] N80-32677
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33268

QUASI-STEADY STATES
A zero-one law for a class of measures on groups
[AD-A088374] N80-33130

QUENCHING (ATOMIC PHYSICS)
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191

QUIET ENGINE PROGRAM
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft --- Ames 40- by 80-ft wind tunnel
[NASA-CR-152349] N80-32337

R

RACKS (FRAMES)
Reracking to increase spent fuel storage capacity, revision 1
[DOE/SR/SF-2004-REV-1] N80-33199

RADAR ANTENNAS
Low sidelobe S-band line source array
[AD-A087651] N80-32616
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632
A parabolic cyclinder reflector system with low sidelobes: Experimental results
[AD-A088202] N80-32639

RADAR DETECTION
Terrain scatter parameter model --- detection of low flying aircraft
[AD-A084248] N80-32626

RADAR ECHOES
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037

RADAR IMAGERY
Multibeam single frequency synthetic aperture radar processor for imaging separate range swaths
[NASA-CASE-NPO-14525-2] N80-32607
Target identification using radar imagery and moment methods
[AD-A088514] N80-32630
Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

RADAR NAVIGATION
NASA aviation safety reporting system
[NASA-TM-81197] N80-32352

RADAR RECEIVERS
Information analysis of dynamical radar parameters
[AD-A088195] N80-32641

RADAR SCATTERING
Terrain scatter parameter model --- detection of low flying aircraft
[AD-A084248] N80-32626

RADAR SIGNATURES
Derivation of narrowband frequency-agile radar signatures from wideband data analysis of X-band data
[AD-A088376] N80-32631
Information analysis of dynamical radar parameters
[AD-A088195] N80-32641

RADAR TRACKING
Millimeter wave radar system concept study, phase 1
[AD-A087767] N80-32620
Two dimensional matched filtering for attitude measurement with applications to target tracking
[AD-A084413] N80-32628
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645
Radiation intensity of the PAVE PAWS radar system
[AD-A088323] N80-32646

RADIANCE
Atmospheric transmittance/radiance: Computer code LOWTRAN 5
[AD-A088215] N80-33042

RADIANT FLUX DENSITY
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645
Radiation intensity of the PAVE PAWS radar system
[AD-A088323] N80-32646
Rare gas halide lasers for fusion N80-32713

RADIANT HEATING
Feasibility study of applying laminar flow control to an LTA vehicle
[AD-A088148] N80-32351
Thermal radiation analysis system TRASYS 2: User's manual
[NASA-CR-159273-1] N80-32690
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691

RADIATION ABSORPTION
Total gamma absorption telescope with multiparametric analysis
[INPE-1804-RPE/172] N80-33321

RADIATION DAMAGE
Optical coatings for laser fusion applications
[UCRL-83582] N80-33238
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278

RADIATION DETECTORS
Detection of 511 KeV annihilation line from the direction of the galactic center
[INPE-1863-RPE/213] N80-33322
A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330

RADIATION DISTRIBUTION
Radiation from an open-ended waveguide with beam equalizer. A spectral domain analysis
[AD-A088179] N80-32642

RADIATION DOSAGE
Sandia National Laboratories 1979 environmental monitoring report
[SAND-80-0342] N80-32982

RADIATION EFFECTS
Radiation evaluation study of LSI RAM technologies
[AD-A084168] N80-32660

RADIATION HAZARDS
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 1: Basic EIS appendices
[AD-A088320] N80-32644
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645

RADIATION MEASUREMENT
Design and implementation of a fiber-optic gamma-measurement system
[UCRL-84109] N80-33219

RADIATION SHIELDING
A demonstration of satellite shielding
[AD-A087752] N80-32421

RADIATION SOURCES
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334
Anomalous isotopic composition of cosmic rays
[UCRL-84561] N80-33335

RADIATIVE TRANSFER
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824

RADIO ALTIMETERS
An atlas of 1977 and 1978 GEOS-3 radar altimeter data for tropical cyclone studies
[NASA-TM-73288] N80-33046
On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088082] N80-33076

RADIO ASTRONOMY
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

RADIO ATTENUATION
CTS attenuation and cross polarization measurements at 11.7 GHz
[NASA-CR-160025] N80-32612

RADIO FREQUENCY DISCHARGE
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625

RADIO FREQUENCY HEATING
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
The microwave applications theory program at NRL and some chemistry code applications to ionospheric heating by microwave radiation
[AD-A088275] N80-33039
Radiofrequency lesion generators, a problem definition study
[PB80-191844] N80-33079

RADIO FREQUENCY INTERFERENCE
Voice communication research evaluation system
[AD-A088100] N80-32635
Experimental measurements of ambient electromagnetic noise from 1.0 to 4.0 kHz
[AD-A088090] N80-32638

RADIO RECEIVERS
Interferometric locating system
[NASA-CASE-NPO-14173-1] N80-32359
Loran-based buoy position auditing systems: Analytical evaluation
[AD-A088266] N80-32369

RADIO TRANSMISSION
Satellite sensing of the solar-terrestrial environment and real-time radio propagation forecasting. Lessons learned from PROPHET. Volume 1: Executive summary
[AD-A088170] N80-32640
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056

RADIOACTIVE ISOTOPES
Design evolution and verification of the general-purpose heat source --- for spacecraft power systems
[DOE/ET-33021/T1] N80-32930
Sandia National Laboratories 1979 environmental monitoring report
[SAND-80-0342] N80-32982
RADIOACTIVE WASTES
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977
Nuclear waste management
[PNL-3000-4] N80-33203
Hydrogeologic effects of natural disruptive events on nuclear waste respositories
[PNL-2858] N80-33206
RADIOACTIVITY
Explosive demolition of activated concrete
[CONF-800542-4] N80-32597
RADIOGRAPHY
Weld evaluation on spherical pressure vessels using holographic interferometry
[UCRL-84079] N80-32745
RADIOMETERS
A 94/183 GHz multichannel radiometer for Convair flights
[NASA-CR-160032] N80-33047
Passive 19.3 GHz radiometer and aerosol data from the North Sea during MARSEN I, September - October 1979
[AD-A088229] N80-33068
RADIOSONDES
A climatological study of the tropospheric circulation over the Amazon region
[INPE-1761-RPE/150] N80-33050
RAILS
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245
RAIN
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064
RAIN FORESTS
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32836
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066
RAIN IMPACT DAMAGE
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385
RAINSTORMS
Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058
RAMAN LASERS
Applications of high resolution inverse Raman spectroscopy
[SAND-80-0639C] N80-32465
RAMAN SPECTRA
Comparison of coherent and spontaneous Raman combustion diagnostics
[SAND-80-8616] N80-32477
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275
RAMAN SPECTROSCOPY
Applications of high resolution inverse Raman spectroscopy
[SAND-80-0639C] N80-32465
Ultra high resolution inverse Raman spectroscopy of methane in a CW free expansion jet
[SAND-80-1370C] N80-32466
Investigation of CARS and laser-induced saturated fluorescence for practical combustion diagnosis
[PB80-190515] N80-32479
RAMJET ENGINES
A preliminary assessment of the impact of 2-D exhaust-nozzle geometry on the cruise range of a hypersonic aircraft with top-mounted ramjet propulsion
[NASA-TM-81841] N80-32397
RANDOM ACCESS MEMORY
Radiation evaluation study of LSI RAM technologies
[AD-A084168] N80-32660
RANDOM LOADS
Response of nonlinear panels to random loads
N80-32766
RANDOM NOISE
Analysis of nonlinear stochastic systems with wide-band inputs
[AD-A088243] N80-33154
RANDOM PROCESSES
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328
RANDOM SAMPLING
Asymptotic conservativeness and efficiency of Kruskal-Wallis test for K dependent samples
[AD-A088249] N80-33157
RANDOM VARIABLES
On the almost sure convergence of weighted sums of random elements in D(0, 1)
[AD-A088330] N80-33144
Detecting change points in sampling from multinomial distributions
[AD-A087898] N80-33150
RANGELANDS
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plans Corridor, US
[E80-10328] N80-32819
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
RANKINE CYCLE
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
RAPID QUENCHING (METALLURGY)
Rapid solidification processing: An outlook
[AD-A088473] N80-33264
RARE GAS-HALIDE LASERS
Rare gas halide lasers for fusion N80-32713
REACTION BONDING
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
REACTION KINETICS
Determination of kinetic parameters for thermal decomposition of phenolic ablative materials by multiple heating rate method
[AD-A087929] N80-32443
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Hydrogen exchange in some coal-related reactions at 400 C
[CONF-800610-7] N80-32463
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469
Fundamentals of nitric oxide formation in fossil fuel combustion
[FE-2018-15] N80-32471
Materials balance for benzene. Level 1: Preliminary
[PB80-185663] N80-32483
Detonations and molecular electronic structure of explosives: Theory and its application to (NO +) sub n
[AD-A088223] N80-32541
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556
Chemical reactions in turbulent mixing
[AD-A088529] N80-32694
Dynamics of the chemistry of electronically excited atoms in defined quantum states --- Halogens, pseudohalogens, and halides
[AD-A088117] N80-33191
Recent developments in nuclear reaction theories and calculations
[UCRL-84369] N80-33202
Chemical reactions on solid surfaces using molecular beam techniques
[AD-A088447] N80-33266
REACTOR DESIGN
Fusion reactor blanket/shield design study
[ANL/FPP-79-1] N80-33242
Tandem mirror reactors with thermal barriers
[UCRL-83505] N80-33244
REACTOR MATERIALS
In-reactor fatigue crack propagation
[HEDL-SA-1927] N80-32803
REACTOR PHYSICS
Large aspect ratio Tokamak study
[ORNL/TM-7278] N80-33239
REACTOR SAFETY
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534
Centrifugal pump performance under simulated two-phase flow conditions
[CONF-800804-7] N80-32727
Development of ultrasonic tomography for residual stress mapping --- in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798
REACTOR TECHNOLOGY
Studies in tandem mirror theory
[UCRL-83519-REV-1] N80-33234
READOUT
High contrast electroluminescent readout device
[AD-A088237] N80-32673
REAL TIME OPERATION
A minimum excursion-time control system
[AD-A087774] N80-33096
RECEIVERS
Alternate waveforms for a low-cost civil global positioning system receiver
[AD-A088345] N80-32371
A monolithic GaAs IF amplifier for integrated receiver applications
[AD-A088298] N80-32670
The 3X Compound Parabolic Concentrating (CPC) solar energy collector
[DOE/CS-04239/T1] N80-32944
RECLAMATION
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
RECOMBINATION REACTIONS
Interactions between small polaronic particles in solids
[SAND-80-0486C] N80-33194
RECTENNAS
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies --- rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861
RECURSIVE FUNCTIONS
A continued fraction representation for Theodorsen's circulation function
[NASA-TM-81838] N80-32330
REDOX CELLS
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
REDUCTION (CHEMISTRY)
Curable liquid hydrocarbon prepolymers containing hydroxyl groups and process for producing same
[NASA-CASE-NPO-13137-1] N80-32514
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265
REDUNDANCY ENCODING
Fault tolerant computer network study
[AD-A088066] N80-33118
REDUNDANT COMPONENTS
Redundant motor drive system
[NASA-CASE-MFS-23777-1] N80-32716
REENTRY EFFECTS
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
Heat transfer and static stability tests of the General Purpose Heat Source (GPHS) configurations at Mach 8.0
[AD-A088031] N80-33287

REENTRY GUIDANCE
Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429
REENTRY PHYSICS
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32331
REENTRY VEHICLES
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349
REFINING
Catalyst characterization in coal liquefaction
[SAND-80-0123] N80-32560
Development of new catalysts for coal liquid refining
[FE-2595-5] N80-32569
REFLECTION
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33036
REFLECTORS
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319
REFRIGERANTS
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902
REFRIGERATING
Magnetic refrigeration for space applications
[LA-UR-80-1566] N80-32596
REGIONAL PLANNING
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Application of remote sensing to state and regional problems — Mississippi
[E80-10338] N80-32826
REGRESSION ANALYSIS
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326
REGULATIONS
Incentives for technological innovation in air pollution reduction: An ETIP (Experimental Technology Incentives Program) policy research series. Volume 2. Market mechanisms for emission regulation and enforcement of emission limits: Deterrence and demand
[PB80-186083] N80-32991
Economic impact of sulfur dioxide and particulate matter regulations in Illinois
[PB80-182645] N80-32992
Incentives for technological innovation in air pollution reduction: An ETIP policy research series. Volume 1: Emission offset policy at work. A summary analysis of 8 cases
[PB80-187610] N80-33022
REINFORCED PLATES
Computational models for the nonlinear analysis of reinforced concrete plates N80-32758
REINFORCEMENT (STRUCTURES)
Analysis of reinforced concrete structures with occurrence of discrete cracks at arbitrary positions N80-32757
RELATIVITY
Diocotron instability of a relativistic coaxial multi-ring hollow electron beam
[AD-A088054] N80-33197
RELIABILITY
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724
Nonparametric empirical Bayes estimation of reliability
[AD-A088182] N80-32742
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109
Some Bayes estimators of reliability for the inverse Gaussian lifetime model
[AD-A088078] N80-33158
REMOTE CONSOLES
Remote hard copy. Volume 2: Operating manual
[SAND-80-0538/2] N80-33297
REMOTE REGIONS
Simple economic evaluation and applications experiments for photovoltaic systems for remote sites
[SAND-80-0749C] N80-32937
REMOTE SENSORS
Collection, processing, and distribution of remote sensing data from Brazilian Receiving Station
[INPE-1784-RPE/156] N80-32832
REMOTELY PILOTED VEHICLES
Investigation of performance, noise, and detectability characteristics of Remotely Piloted Vehicle (RPV) propellers
[AD-A088325] N80-32398
RESEARCH AIRCRAFT
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft — Ames 40- by 80-ft wind tunnel
[NASA-CR-152349] N80-32337
RESEARCH FACILITIES
Federal Laboratory Consortium resource directory
[PB80-199078] N80-32409
RESEARCH MANAGEMENT
Project SQUID
[AD-A088006] N80-32401
NASA authorization for fiscal year 1979, part 1
[GPO-25-603] N80-33311
RESIDENTIAL AREAS
Data resources in housing and urban development
[PB80-188071] N80-33302
RESIDENTIAL ENERGY
Operation and maintenance cost data for residential photovoltaic modules/panels
[NASA-CR-163585] N80-32855
Theory and design of an Annual Cycle Energy System (ACES) for residences
[ORNL/CON-43] N80-32904
Economic evaluation of the Annual Cycle Energy System (ACES). Volume 1: Executive summary
[ORNL/SUB-7470/1-V1] N80-32905
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957
RESIDUAL STRESS
A comparison of residual stress measuring techniques: Their strengths and weaknesses
[AD-A088409] N80-32779
PUFF TOO: A residual stress experiment — underground explosions
[SAND-79-1674] N80-32788
Development of ultrasonic tomography for residual stress mapping — in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798
RESOLUTION
Phosphor-penetration color cathode-ray tube
[AD-A088518] N80-32665
RESONANCE SCATTERING
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
RESONANT FREQUENCIES
Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346
A bounds on the resonant frequency of rectangular microstrip antennas
[NASA-TM-81882] N80-32609
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040
RESONATORS
Acceleration sensitivity compensation of crystal resonators
[AD-A085683] N80-32662
The effect of vibration on quartz crystal resonators
[AD-A085642] N80-32677
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33268
RESOURCE ALLOCATION
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843
RESOURCES MANAGEMENT
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
RESPIRATORS
The design of a fluidic oxygen intermittent demand flow device
[AD-A084083] N80-33097
RETROFITTING
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942
REVERSE FIELD PINCH
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
Reversed-field pinch fusion reactor
[LA-UR-80-1494] N80-33246
Initial reversed-field pinch experiments on ZT-40 and recent advances in RFP theory
[LA-UR-80-1834] N80-33248
REVISIONS
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32490
REYNOLDS NUMBER
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90 — conducted in Langley 6 by 28 inch transonic tunnel
[NASA-TP-1701] N80-32333
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32049
RHODIUM
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A088118] N80-32457
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265
RICCATI EQUATION
Approximation schemes for the linear-quadratic optimal control problem associated with delay equations
[AD-A088245] N80-33121
The Riccati integral equation arising in optimal control of delay differential equations
[AD-A088097] N80-33122
RIGID STRUCTURES
Inelastic behavior of structural components N80-32773
RING STRUCTURES
A void growth failure criterion applied to dynamically and statically loaded thin rings
[AD-A088515] N80-32781
RISK
Realistic approach to the planning of high-technology, high-risk projects
[SAND-79-1483] N80-33290
RIVER BASINS
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834
RIVERS
Evaluation of remote sensing techniques on selected forest sites in Florida — Fort Myers and Gainesville test sites
[E80-10296] N80-32805
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32831
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834

Saint Lawrence River all-year navigation ice control system
[PB80-183478] N80-32841

RL-10 ENGINES
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432

ROADS
Permanent deformation of flexible pavements
[AD-A087859] N80-32588
Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32601

ROBOTS
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093

ROCKET ENGINE CONTROL
A study on various methods of supplying propellant to an orbit insertion rocket engine
[TRW/DSSG-36358.001] N80-32413

ROCKET ENGINE DESIGN
Orbit transfer vehicle engine study. Volume 1: Executive summary
[NASA-CR-161563] N80-32431
Orbit transfer vehicle engine study. Volume 2: Technical report
[NASA-CR-161564] N80-32432
Orbit transfer vehicle engine study. Volume 3: Program costs
[NASA-CR-161574] N80-32433

ROCKET ENGINES
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856

ROCKET EXHAUST
Photographic spectroscopic measurement of ultraviolet solid rocket motor plumes
[AD-A088438] N80-32434

ROCKS
Technique for studying multiple fractures produced at intermediate loading rates
[UCRL-83653] N80-32797

ROTARY STABILITY
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335

ROTARY WINGS
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385

ROTATING GENERATORS
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725

ROTOR AERODYNAMICS
Development of flexible rotor balancing criteria
[NASA-CR-159506] N80-32720

ROTORS
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725
Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910

ROVING VEHICLES
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652

ROWLAND CIRCLES
Development of a temporally and spatially resolved grazing incidence spectrometer
[UCRL-83808] N80-32464

RUNWAY CONDITIONS
New concept study for repair of bomb-damaged runways. Volume 1: Concept identification
[AD-A088188] N80-32407

RUNWAYS
New concept study for repair of bomb-damaged runways. Volume 1: Concept identification
[AD-A088188] N80-32407

RURAL AREAS
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045

RURAL LAND USE
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Mapping model for determining land suitable for irrigation
[PB80-188683] N80-32843

S

S MATRIX THEORY
Qualitative matrices: Strong sign-solvability and weak satisfiability
[AD-A087686] N80-33168

SACRAMENTO VALLEY (CA)
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822

SAFETY
OH-58C helicopter mast mounted sight/designator safety statement
[AD-A087673] N80-32390

SAFETY DEVICES
Aircraft crashworthiness studies: Findings in accidents involving an aerial application aircraft
[AD-A084619] N80-32356

SAFETY MANAGEMENT
Evaluation of safety programs with respect to the causes of general aviation accidents: Volume 1: Technical report
[AD-A087685] N80-32355
Studies on the removal of carbon monoxide from the atmosphere at ambient temperture --- submarine atmospheres
[AD-A085469] N80-33098

SALINITY
Geochemistry of some Brazilian rivers
[INPE-1797-RPE/167] N80-32831
Geochemical balance of the Salgado River basin
[INPE-1649-RPE/206] N80-32834

SALT BATHS
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534

SALT SPRAY TESTS
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385

SALTS
Energy storage as heat-of-fusion in containerized salts. Report on energy storage boiler tank
[AD-A087753] N80-32862

SAMPLING
Estimation of the P(CS) with a computer program, revision
[AD-A088058] N80-33108

SAN JOAQUIN VALLEY (CA)
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817

SANDWICH STRUCTURES
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786

SATELLITE CONFIGURATIONS
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692

SATELLITE DESIGN
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies --- rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861

SATELLITE GROUND SUPPORT
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies --- rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861

SATELLITE GROUND TRACKS
Seasat-A land applications data processing plan
[E80-10317] N80-32810

SATELLITE OBSERVATION
Earth's rotation in 1975-1979 based on Doppler satellite observations
[AD-A088095] N80-32804

SATELLITE POWER TRANSMISSION (TO EARTH)
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859
Satellite power system (SPS) concept definition study. Volume 3: Experimental verification definition
[NASA-CR-3320] N80-32860
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies --- rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861

SATELLITE SOLAR ENERGY CONVERSION
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928

SATELLITE SURFACES
Coordinates of features on the Galilean satellites
[NASA-CR-163582] N80-33326

SATELLITE TRANSMISSION
Satellite Instructional Television Experiment. Television comes to village: An evaluation of SITE
[ISRO-SAC-TR-09-78] N80-32611

SCALE MODELS
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910

SCALING LAWS
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507

SCANNERS
Control electronics for a multi-laser/multi-detector scanning system
[NASA-CR-163565] N80-32652
Automatic visual inspection of hybrid microcircuits
[BDX-613-2359] N80-32747

SCATTERING CROSS SECTIONS
Recent developments in nuclear reaction theories and calculations
[UCRL-84369] N80-33202

SCENE ANALYSIS
Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32805
High Density Tape Reformatting System/LANDSAT Imagery Verification and Extraction System (HDTRS/LIVES) production test throughput analysis
[E80-10319] N80-32811

SCHOTTKY DIODES
Electronic processes in InP and related compounds
[AD-A088446] N80-33263

SCOUT LAUNCH VEHICLE
Environmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416

SCRUBBERS
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007

SEA TRUTH
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820

SEA WATER
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820

SEALERS
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527

SEALING
Glasses and glass ceramics for sealing to aluminum alloys
[SAND-79-1405C] N80-32528
SEARCH RADAR
Millimeter wave radar system concept study, phase 1
[AD-A087767] N80-32620
SEASAT-A SATELLITE
Seasat-A land applications data processing plan
[E80-10317] N80-32810
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
SEAT BELTS
Aircraft crash survival design guide. Volume 4: Aircraft seats, restraints, litters, and padding
[AD-A088441] N80-32358
SEDIMENT TRANSPORT
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
SEDIMENTS
Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316
SEEDS
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
SEISMIC ENERGY
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033
SEISMOLOGY
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024
SELECTION
Estimation of the P(CS) with a computer program, revision
[AD-A088058] N80-33108
SELECTIVE DISSEMINATION OF INFORMATION
Federal Laboratory Consortium resource directory
[PB80-199078] N80-32409
Proceedings of the Ocean Energy Information Dissemination Workshop
[SERI/TP-732-600] N80-32956
Data resources in housing and urban development
[PB80-188071] N80-33302
Applying scientific and technological resources for North Dakota policy development: State Science, Engineering and Technology program
[PB80-189624] N80-33306
SEMICONDUCTOR DEVICES
Apparatus for measuring semiconductor device resistance
[NASA-CASE-NPO-14424-1] N80-32650
Design, fabricate and test an Electron Bombarded Semiconductor (EBS) amplifier
[NASA-CR-160002] N80-32656
Semiconductor measurement technology
[AD-A088262] N80-32668
Acoustic holography. Citations from the Engineering index data base
[PB80-812548] N80-32708
Reliability considerations of electronics components for the deep underwater muon and neutrino detection system
[LBL-10548] N80-32744
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32884
Semiconductor technology program, program briefs
[NASA-CR-163592] N80-33285
SEMICONDUCTOR JUNCTIONS
A study of metal-semiconductor contacts on indium phosphide
[AD-A087666] N80-33256
SEMICONDUCTORS (MATERIALS)
Semiconductor measurement technology
[AD-A088262] N80-32668
Cuprous oxide photovoltaic cells
[DOE/ET-23010/17] N80-32932
Self-consistent APW-k-vector, p vector method. 1: Theory
[INPE-1763-RPE/152] N80-33252
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254
Semiclassical Boltzmann transport theory in semiconductors
[AD-A084161] N80-33259
Nondestructive evaluation of Si wafers using SAW
[AD-A084665] N80-33260
Electronic process in InP and related compounds
[AD-A084260] N80-33261
A study of secondary ion triple bond analogues
[AD-A088423] N80-33262
Electron tunneling into superconducting indium and lead films containing the magnetic impurity manganese
[DOE/ER-01198/1316] N80-33284
SENSITIVITY
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-329[illegible]
SEPARATED FLOW
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32336
Numerical solution of a nonsteady blast wave propagation in two-phase (separated flow) reactive medium
[TAE-388] N80-32686
The mechanism of a detonation wave enhancement in a two-phase combustible medium
[TAE-393] N80-32687
SEQUENTIAL ANALYSIS
Detecting change points in sampling from multinomial distributions
[AD-A087898] N80-33150
SEQUENTIAL CONTROL
The off-line use of a sequential estimator
[AD-A088178] N80-33142
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276
SERUMS
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085
SERVICE LIFE
Oxygen electrodes for energy conversion and storage
[DOE/ET-25502/1] N80-32878
Catalyst effectiveness of high mileage in use vehicles
[PB80-192776] N80-33008
SERVOMECHANISMS
Computer coordination of limb motion for a three-legged walking robot
[NASA-CR-163566] N80-33093
SERVOMOTORS
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724
SET THEORY
On measuring the conformity of a parameter set to a trend, with applications
[AD-A087946] N80-33133
SEWAGE
Phosphorous control strategies at municipal wastewater treatment plants in the US Great Lakes Basin
[PB80-191059] N80-32998
SHALE OIL
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
Synthetic fuels from US oil shales: A technical and economic verification of the HYTORT process
[DOE/ET-14102-2] N80-32567
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796
SHALES
The effect of compacted prestress on compacted shale compressibility
[PB80-191158] N80-32602
SHEAR PROPERTIES
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796
SHEAR STRAIN
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786
SHEAR STRENGTH
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437
SHEAR STRESS
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
SHELLS (STRUCTURAL FORMS)
Corotational velocity strain formulations for nonlinear analysis of beams and axisymmetric shells
N80-32775
SHIELDING
Fusion materials high energy-neutron studies
[HEDL-SA-2145-FP] N80-33207
SHIPS
Investigation of transient induced aerodynamics in a moving deck environment
[AD-A088164] N80-32350
SHOCK LOADS
Shock compression of tantalum
[AD-A088152] N80-32499
SHOCK RESISTANCE
Vibration resistant quartz crystal resonators
[AD-A088266] N80-33268
SHOCK WAVE INTERACTION
Interaction between a normal shock wave and a turbulent boundary layer at high transonic speeds. Part 1: Pressure distribution. Part 2: Wall shear stress. Part 3: Simplified formulas for the prediction of surface pressures and skin friction
[NASA-CR-3194] N80-32320
SHOCK WAVES
Interaction between a normal shock wave and a turbulent boundary layer at high transonic speeds. Part 1: Pressure distribution. Part 2: Wall shear stress. Part 3: Simplified formulas for the prediction of surface pressures and skin friction
[NASA-CR-3194] N80-32323
Numerical solution of a nonsteady blast wave propagation in two-phase (separated flow) reactive medium
[TAE-388] N80-32686
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A088335] N80-32785
Theory of time-dependent rupture in the Earth
[NASA-CR-163567] N80-33024
SHORT CIRCUITS
Coatings for graphite fibers
[NASA-CR-159304] N80-32439
SHORT HAUL AIRCRAFT
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft — Ames 40- by 80-ft wind tunnel
[NASA-CR-152349] N80-32337
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
SHORT TAKEOFF AIRCRAFT
A comparison of flight and simulation data for three automatic landing system control laws for the Augmentor wing jet STOL research airplane
[NASA-CR-152365] N80-32338
Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382
SHRAPNEL
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535

SIDELOBES
Low sidelobe S-band line source array
[AD-A087651] N80-32616
A parabolic cyclinder reflector system with low sidelobes: Experimental results
[AD-A088202] N80-32639
SIGNAL ANALYSIS
The reconstruction of analog signals from the sign of their noisy samples
[AD-A087650] N80-32615
SIGNAL FADING
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085780] N80-32625
SIGNAL PROCESSING
System for plotting subsoil structure and method therefor
[NASA-CASE-NPO-14191-1] N80-32584
The reconstruction of analog signals from the sign of their noisy samples
[AD-A087650] N80-32615
Noise suppression methods for robust speech processing
[AD-A085667] N80-32629
Present and future trends in signal processing technologies
[AD-A088085] N80-32634
Preliminary development of digital signal processing in microwave radiometers
[NASA-CR-3327] N80-32655
Comparison of detection performance of selected two-channel algorithms
[AD-A087797] N80-33126
A constant percentage bandwidth transform for acoustic signal processing
[AD-A085686] N80-33178
Signal processing aspects of nonlinear acoustics
[AD-A088369] N80-33181
SIGNAL TO NOISE RATIOS
Initial data bank report: Fall 1978, winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372
Two-photon excitation of nitric oxide fluorescence as a temperature indicator in unsteady gas-dynamic processes
[NASA-TM-81220] N80-32700
SIGNAL TRANSMISSION
Transmission of 565 Mbit/s signals via coaxial cables
[BLL-RDL-TRANS-3793-(7737.470)] N80-32606
Techniques for measuring arrival times of pulsar signals 1: DSN observations from 1968 to 1980
[NASA-CR-163564] N80-33317
SIGNATURE ANALYSIS
Characterization of Cerrado vegetation using automatically classified LANDSAT MSS data
[INPE-1790-RPE/162] N80-32835
SILICON
Semiconductor measurement technology
[AD-A088262] N80-32668
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852
Study program for encapsulation materials interface for low cost silicon solar array
[NASA-CR-163583] N80-32857
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32884
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-23044/4] N80-32920
Amorphous thin films for solar-cell applications
[DOE/ET-21074/4] N80-32921
Photovoltaic mechanisms in polycrystalline thin-film silicon solar cells
[DOE/ET-23108/2] N80-32923
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
Investigation of the impurity tolerance of semicrystalline silicon solar cells silicon impact program
[DOE/CH-00178-T2] N80-32934
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1562-RPE/212] N80-33254
Crystalline silicon on insulators by graphoepitaxy — laser crystallization
[AD-A085435] N80-33257
Nondestructive evaluation of Si wafers using SAW
[AD-A084665] N80-33260
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276
SILICON FILMS
Solid-phase epitaxial growth — of Si single crystal films
[AD-A084175] N80-33258
SILICON NITRIDES
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
Accelerated life testing effects on CMOS microcircuit characteristics
[NASA-CR-161575] N80-32853
SILICON POLYMERS
Synthesis and characterization of new silicone condensation polymers
[UCRL-84304] N80-32530
SILOXANES
Structure-property relationships of linear methyl-phenyl-vinyl siloxane terpolymers
[UCRL-84303] N80-32529
SILVER
Vibrational frequencies of halogen atoms adsorbed on silver metal surfaces
[AD-A087664] N80-32491
SINGLE CRYSTALS
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
Solid-phase epitaxial growth — of Si single crystal films
[AD-A084175] N80-33258
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33268
Automated X-ray orientation for quartz crystal resonators
[AD-A088063] N80-33272
SITE SELECTION
Environmental implications of electric utility supply plans, 1978-2000
[PB80-192156] N80-32963
SKIN FRICTION
Some aerodynamic considerations related to wind tunnel model surface definition
[NASA-TM-81820] N80-32376
SLAGS
Condensation processes in coal combustion products
[DOE/ER-10456/1] N80-32473
SLIDING FRICTION
Solutions of contact problems by the assumed stress hybrid model N80-32771
Finite elements for contact problems in two-dimensional elastodynamics N80-32772
SLURRIES
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000
SMOG
Evaluation of carbon monoxide in blood samples from the second national health and nutrition survey
[COO-4552-2] N80-33089
SNOW COVER
Multipath propagation over snow at millimeter wavelengths
[AD-A087747] N80-32618
SOCIAL FACTORS
Costing methodologies for energy systems
[BNL-27603] N80-32900
SODIUM
Geochemical balance of the Salgado River basin
[INPE-1849-RPE/206] N80-32834
Seasonal variation of ozone in the mesosphere
[INPE-1800-RPE/170] N80-33031
Mesospheric winds from lidar observations of atmospheric sodium
[INPE-1811-RPE/179] N80-33051
SODIUM CHLORIDES
Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32801
SOIL EROSION
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10328] N80-32817
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316
SOIL MOISTURE
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32590
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution — South Dakota
[E80-10310] N80-32806
Irrigated lands assessment for water management Applications Pilot Test (APT) — California
[E80-10324] N80-32815
Infrared-temperature variability in a large agricultural field — Dunnigan, California
[E80-10331] N80-32822
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) — France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/168] N80-32836
SOIL SCIENCE
System for plotting subsoil structure and method therefor
[NASA-CASE-NPO-14191-1] N80-32584
SOILS
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
Application of remote sensing to selected problems within the state of california — Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
SOLAR ACTIVITY
Scale size of the cosmic ray modulating region
[INPE-1826-RPE/192] N80-33331
SOLAR ARRAYS
Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163568] N80-32852
A computer model of solar panel-plasma interactions
[NASA-CR-160798] N80-32853
Operation and maintenance cost data for residential photovoltaic modules/panels
[NASA-CR-163585] N80-32855
Study program for encapsulation materials interface for low cost silicon solar array
[NASA-CR-163583] N80-32857
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859
Satellite power system (SPS) concept definition study. Volume 3: Experimental verification definition
[NASA-CR-3320] N80-32860
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-80-1569C] N80-32936
SOLAR ATMOSPHERE
A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330
SOLAR CELLS
Improving the efficiency of silicon solar cells containing chromium
[NASA-CASE-NPO-15179-1] N80-32950

Low-cost solar array project and Proceedings of the 15th Project Integration Meeting
[NASA-CR-163588] N80-32852
Investigation of the impurity tolerance of semicrystalline silicon solar cells: Silicon impact program
[DSE-4042-T41] N80-32884
Silicon concentrator solar cell manufacturing development
[SAND-80-7018] N80-33996
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32916
CdSiAs2 thin films for solar cell applications
[DOE/ET-23007/1] N80-32919
Deposition, fabrication and analysis of polycrystalline silicon MIS solar cells
[DOE/ET-22044/4] N80-32920
Amorphous thin films for solar-cell applications
[DOE/ET-21074/4] N80-32921
Photovoltaic mechanisms in polycrystalline thin-film silicon solar cells
[DOE/ET-23108/2] N80-32923
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928
Development of copper sulfide/cadmium sulfide thin film solar cells
[DSE-4042-T42] N80-32931
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
Investigation of the impurity tolerance of semicrystalline silicon solar cells silicon impact program
[DOE/CH-00178-T2] N80-32934
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-80-1569C] N80-32936
Simple economic evaluation and applications experiments for photovoltaic systems for remote sites
[SAND-80-0749C] N80-32937
Concentrating photovoltaic for the Tropics
[DOE/CS-04270/1] N80-32954

SOLAR COLLECTORS
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
Fluid temperature control for parabolic trough solar collectors
[SAND-79-2006C] N80-32894
Parabolic trough solar collector wind loading
[SAND-79-2134C] N80-32895
Fundamentals and techniques of nonimaging optics for solar energy concentration
[DOE/ER-04657/2] N80-32896
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914
Feasibility study on a solar house heating system with a low quality thermal flow
[EUR-6696-EN] N80-32939
The 3X Compound Parabolic Concentrating (CPC) solar energy collector
[DOE/CS-04239/T1] N80-32944
Thermographic techniques applied to solar collector systems analysis
[SERI/TP-351-540] N80-32946
Solar ponds and their applications
[SERI/TP-733-617] N80-32947
Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950
Self controlling, self pumping heat circulation system study
[COO-4484-07] N80-33952
Solar passive systems for buildings
[PB80-187719] N80-32962

SOLAR COOLING
Monitoring of the performance of a solar heated and cooled apartment building
[DSE-5235-T1] N80-32913

SOLAR ENERGY
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851
Use of solar energy to produce process heat for industry
[SERI/TP-731-626] N80-32863
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874
Planning for electric utility solar applications: The effects on reliability and production cost estimates of the variability in demand
[SERI/TP-351-545] N80-32888
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32893
Research and development for inertial energy storage based on a flexible flywheel
[SAND-79-7097] N80-32898
Seasonal thermal energy storage
[PNL-3322] N80-32899
Solar index generation and delivery
[DOE/ET-20090/3] N80-32929
Gallium arsenide photovoltaic dense array for concentrator applications
[SAND-79-2270C] N80-32938
Feasibility study on a solar house heating system with a low quality thermal flow
[EUR-6696-EN] N80-32939
Line-focus solar central power system, phase 1. Subsystem experiment: Receiver heat transfer
[DOE/ET-20550/1] N80-32945
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Department of Housing and Urban Development solar hot water initiative: Centralized coordination of technical tasks and system evaluation
[PB80-189244] N80-32961
Solar passive systems for buildings
[PB80-187719] N80-32962
Environmental data for sites in the National Solar data network
[SOLAR/0010-80/05] N80-32986

SOLAR ENERGY ABSORBERS
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890
Oxidation of electrodeposited black chrome selective solar absorber films
[SAND-80-1045C] N80-32953

SOLAR ENERGY CONVERSION
Hydrogen production by photoelectrolytic decomposition of H2O using solar energy
[NASA-CR-163586] N80-32854
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859
Line-focus solar thermal energy technology development. Report for Department 4720
[SAND-80-0865-REV] N80-32887
Chemical energy storage for solar thermal conversion
[SAND-79-8198] N80-32889
Fundamentals and techniques of nonimaging optics for solar energy concentration
[DOE/ER-04657/2] N80-32896
Potential for supplying solar thermal energy to industrial unit operations
[SERI/TP-632-584] N80-32911
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927
Concentrating photovoltaic for the Tropics
[DOE/CS-04270/1] N80-32954
Potential displacement of petroleum imports by solar energy technologies
[SERI/TR-352-504] N80-32959
Forecasts of energy technology. Citations from the International Aerospace Abstracts data base
[NASA-CR-163596] N80-32965

SOLAR FLARES
Ion production in the D-region --- through cosmic rays during solar flares and geomagnetic storms
[AD-A085533] N80-33038
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328
Solar-geophysical data number 427, March 1980, part 1 (Prompt reports)
[PB80-194871] N80-33329
A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330

SOLAR FURNACES
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

SOLAR GENERATORS
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32915
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935
Line-focus solar central power system, phase 1. Subsystem experiment: Receiver heat transfer
[DOE/ET-20550/1] N80-32945

SOLAR HEATING
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851
Monitoring of the performance of a solar heated and cooled apartment building
[DSE-5235-T1] N80-32913
Solar index generation and delivery
[DOE/ET-20090/3] N80-32929
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Solar passive systems for buildings
[PB80-187719] N80-32962

SOLAR MAXIMUM MISSION
Solar Maximum Mission
[NASA-TM-82192] N80-33327

SOLAR NEUTRINOS
A 2.2 MeV gamma ray line observed during a SN solar flare
[INPE-1842-RPE/202] N80-33330

SOLAR PONDS (HEAT STORAGE)
Solar ponds and their applications
[SERI/TP-733-617] N80-32947

SOLAR POWER SATELLITES
A computer model of solar panel-plasma interactions
[NASA-CR-160796] N80-32853
Satellite Power Systems (SPS) concept definition study. Volume 6: In-depth element investigation
[NASA-CR-3323] N80-32859
Satellite power system (SPS) concept definition study. Volume 3: Experimental verification definition
[NASA-CR-3320] N80-32860
Satellite Power Systems (SPS) concept definition study. Volume 5: Special emphasis studies --- rectenna and solar power satellite design studies
[NASA-CR-3322] N80-32861
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928

SOLAR PROTONS
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328

SOLAR RADIATION
Spectral character of solar and circumsolar radiation --- for application to concentrating solar energy systems
[LBL-10802] N80-32916
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048
SOLAR RADIO EMISSION
Solar-geophysical data number 427, March 1980, part 1 (Prompt reports)
[PB80-194871] N80-33329
SOLAR TOTAL ENERGY SYSTEMS
Comparison of solar-thermal and fossil total-energy systems for selected industrial applications
[ORNL/TM-7022] N80-32871
Self controlling, self pumping heat circulation system study
[COO-4484-07] N80-32952
SOLAR WIND
Solar-geophysical data number 427, March 1980, part 1 (Prompt reports)
[PB80-194871] N80-33329
SOLDERS
Low-temperature solder for joining large cryogenic structures --- cooling cools for the National Transonic Facility
[NASA-TM-81836] N80-32490
SOLID PHASES
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535
Solid-phase epitaxial growth --- of Si single crystal films
[AD-A084175] N80-33258
SOLID PROPELLANT IGNITION
Transient ignition mechanisms of confined solid propellants under rapid pressurization
[AD-A088080] N80-32539
SOLID ROCKET PROPELLANTS
Photographic spectroscopic measurement of ultraviolet solid rocket motor plumes
[AD-A088438] N80-32434
Combustion: Structural interaction in a viscoelastic material N80-32761
SOLID STATE DEVICES
Solid state audio/speech processor analysis
[AD-A084743] N80-32623
SOLID SURFACES
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176
Panel report on theory of surfaces
[DOE/ER-01198/1307] N80-33281
SOLIDIFICATION
Rapid solidification processing: An outlook
[AD-A088473] N80-33264
SOLIDS
Molecular dynamic shock wave studies in solids, fracture and crack propagation
[AD-A088335] N80-32785
SOLITARY WAVES
Solitons and the inverse scattering transform
[AD-A088023] N80-33141
SOLVENT REFINED COAL
Hydrogen exchange in some coal-related reactions at 400 C
[CONF-800610-7] N80-32463
Catalytic hydrogenation of coal-derived liquids
[FE-2034-18] N80-32558
SOLVENTS
Estimation rate constants for diffusion-controlled intermacromolecular reactions at infinite dilution
[ISAS-580-VOL-45-NO-5] N80-33251
SOOT
Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731
SORPTION
Sorption properties of sediments and energy-related pollutants
[PB80-189574] N80-32997
SOUND FIELDS
Multiple pure tone elimination strut assembly
[NASA-CASE-FRC-11062-1] N80-32393
SOUND INTENSITY
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184
SOUND PROPAGATION
System for plotting subsoil structure and method therefor
[NASA-CASE-NPO-14191-1] N80-32584
SOUND WAVES
Acceleration sensitivity compensation of crystal resonators
[AD-A085683] N80-32662
Statistical energy analysis of complex structures, phase 2
[NASA-CR-161576] N80-32752
Signal processing aspects of nonlinear acoustics
[AD-A088369] N80-33181
SOUNDING
Feasibility of modifying the high resolution infrared radiation sounder (HIRS/2) for measuring spectral components of Earth radiation budget
[NASA-CR-159353] N80-32430
SOUTH DAKOTA
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
SOUTHERN CALIFORNIA
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
SOUTHERN HEMISPHERE
Vertical velocity forced by topography in the Southern Hemisphere
[INPE-1691-RPE/119] N80-33052
SOYBEANS
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818
SPACE COOLING (BUILDINGS)
Heat pumps in low temperature applications
[CONF-800806-7] N80-32699
Thermal energy storage for building heating and cooling applications
[ORNL-TM-7319] N80-32879
Annual Cycle Energy System (ACES)
[ORNL/CON-42] N80-32880
Seasonal thermal energy storage
[PNL-3322] N80-32899
Theory and design of an Annual Cycle Energy System (ACES) for residences
[ORNL/CON-43] N80-32904
Monitoring of the performance of a solar heated and cooled apartment building
[DSE-5235-T1] N80-32913
SPACE ENVIRONMENT SIMULATION
Envrionmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416
SPACE ERECTABLE STRUCTURES
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319
SPACE FLIGHT STRESS
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085
SPACE HEATING (BUILDINGS)
Heat pumps in low temperature applications
[CONF-800806-7] N80-32699
Thermal energy storage for building heating and cooling applications
[ORNL-TM-7319] N80-32879
Annual Cycle Energy System (ACES)
[ORNL/CON-42] N80-32880
Seasonal thermal energy storage
[PNL-3322] N80-32899
Theory and design of an Annual Cycle Energy System (ACES) for residences
[ORNL/CON-43] N80-32904
Economic evaluation of the Annual Cycle Energy System (ACES). Volume 1: Executive summary
[ORNL/SUB-7470/1-V1] N80-32905
Monitoring of the performance of a solar heated and cooled apartment building
[DSE-5235-T1] N80-32913
Feasibility study on a solar house heating system with a low quality thermal flow
[EUR-6696-EN] N80-32939
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950
Development of an energy consumption and cost data base for fuel cell total energy systems and conventional building energy systems
[ORNL/CON-38] N80-32980
Solar passive systems for buildings
[PB80-187719] N80-32962
Environmental data for sites in the National Solar data network
[SOLAR/0010-80/05] N80-32986
SPACE MISSIONS
Solar Maximum Mission
[NASA-TM-82192] N80-33327
SPACE NAVIGATION
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32364
SPACE PLASMAS
A computer model of solar panel-plasma interactions
[NASA-CR-160796] N80-32853
Survey of the plasma electron environment of Jupiter: A view from Voyager
[NASA-TM-80731] N80-33325
SPACE PLATFORMS
Technology for large space systems. A special bibliography with indexes, supplement 3
[NASA-SP-7046(03)] N80-32410
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-32414
SPACE PROBES
Titan probe technology assessment and technology development plan study
[NASA-CR-152381] N80-32417
SPACE SHUTTLE ORBITERS
Shuttle OFT level C navigation requirements: On-orbit
[NASA-TM-82205] N80-32363
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389
Potential problems relative to TDRS/IUS tilt table elevation with failed VRCS
[NASA-TM-82201] N80-32411
Technological innovation in the design and development of the space transportation system
[NASA-TM-82190] N80-32423
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425
User's guide for the Flight Design System (FDS)
[NASA-TM-82202] N80-32426
Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32692
SPACE SHUTTLE PAYLOADS
Envrionmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416
SPACE SHUTTLES
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424
SPACE SIMULATORS
Changes in erythropoietin levels during space flight or space flight simulation
[NASA-CR-163591] N80-33085
SPACE TRANSPORTATION SYSTEM
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32364
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-32414
Technological innovation in the design and development of the space transportation system
[NASA-TM-82190] N80-32423
SPACE TRANSPORTATION SYSTEM 1 FLIGHT
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424

STS-1 operational flight profile. Volume 1: Ground rules and constraints cycle 3.1.1.
[NASA-TM-82200] N80-32427

SPACEBORNE ASTRONOMY
Solar Maximum Mission
[NASA-TM-82192] N80-33327

SPACECRAFT CHARGING
Satellite spacecraft charging control materials
[AD-A087675] N80-32420
Modelling of environmentally induced discharges in geosynchronous satellites
[NASA-TM-81598] N80-32428

SPACECRAFT COMPONENTS
Satellite spacecraft charging control materials
[AD-A087675] N80-32420

SPACECRAFT LAUNCHING
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829
A study of the applicability/compatibility of inertial energy storage systems to future space missions
[NASA-CR-163584] N80-32856
Solar Maximum Mission
[NASA-TM-82192] N80-33327

SPACECRAFT PERFORMANCE
Seasat. Volume 2: Flight systems
[NASA-CR-163571] N80-32829

SPACECRAFT POWER SUPPLIES
Design evolution and verification of the general-purpose heat source --- for spacecraft power systems
[DOE/ET-33021/T1] N80-32930
Nickel cadmium batteries. Citations from the NTIS data base
[PB80-812340] N80-32966

SPACECRAFT RADIATORS
Magnetic refrigeration for space applications
[LA-UR-80-1566] N80-32596

SPACECRAFT REENTRY
Development of the reentry flight dynamics simulator for evaluation of space shuttle orbiter entry systems
[NASA-TP-1700] N80-32429

SPACECRAFT SHIELDING
A demonstration of satellite shielding
[AD-A087752] N80-32421

SPACELAB
UAH/NASA Workshop on Space Science Platform
[NASA-TM-82204] N80-32414

SPALLING
Shock compression of tantalum
[AD-A088152] N80-32499

SPARK GAPS
Development of a 50 Hz, 250 kV, 500 ns, 500 KW average power pulse
[SAND-80-0491C] N80-32684

SPATIAL DISTRIBUTION
Initial data bank report: Fall 1978; winter, spring, summer, fall 1979, winter 1980
[AD-A088204] N80-32372

SPATIAL FILTERING
Development of a temporally and spatially resolved grazing incidence spectrometer
[UCRL-83808] N80-32464

SPECIFIC HEAT
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
The Hubbard model for the disordered systems: In application to the specific heat of the phosphorus-doped silicon
[INPE-1862-RPE/212] N80-33254

SPECIMEN GEOMETRY
Fracture toughness of brittle materials determined with chevron notch specimens
[NASA-TM-81607] N80-32486

SPECTRA
Photographic spectroscopic measurement of ultraviolet solid rocket motor plumes
[AD-A088438] N80-32434

SPECTRAL BANDS
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032

SPECTRAL ENERGY DISTRIBUTION
Spectral character of solar and circumsolar radiation --- for application to concentrating solar energy systems
[LBL-10802] N80-32916
Semiconductor technology program, program briefs
[NASA-CR-163592] N80-33285

SPECTRAL REFLECTANCE
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plans Corridor, US
[E80-10328] N80-32819

SPECTRAL SIGNATURES
A multiprocessor implementation of a contextual image processing algorithm
[E80-10313] N80-32808
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818
Characterization of Cerrado vegetation using automatically classified LANDSAT MSS data
[INPE-1790-RPE/162] N80-32835
Reduction and assessment of infrared background data
[AD-A088241] N80-33218

SPECTROMETERS
Development of a temporally and spatially resolved grazing incidence spectrometer
[UCRL-83808] N80-32464
Optical aerosol spectrometers factors affecting optical extinction predictions
[AD-A087656] N80-33035

SPECTROSCOPIC ANALYSIS
Electron paramagnetic resonance spectroscopy of vanadium (IV) complexes and related species
[AD-A088311] N80-32458
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460

SPECTRUM ANALYSIS
Applications of high resolution inverse Raman spectroscopy
[SAND-80-0639C] N80-32465
Dynamic modal estimation using instrumental variables
[NASA-CR-152396] N80-32777
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193881] N80-32845
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275

SPEECH
Noise suppression methods for robust speech processing
[AD-A085667] N80-32629

SPEECH RECOGNITION
Solid state audio/speech processor analysis
[AD-A084743] N80-32623
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

SPENT FUELS
Reracking to increase spent fuel storage capacity, revision 1
[DOE/SR/SF-2004-REV-1] N80-33199
Nuclear waste management
[PNL-3000-4] N80-33203

SPHERICAL HARMONICS
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149

SPHEROMAKS
Compact torus experiments and theory
[LA-UR-80-1826] N80-33249

SPIN TESTS
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335

SPLINE FUNCTIONS
Identification of nonlinear delay systems using spline methods
[AD-A088251] N80-33134
Numerical regularization of ill-posed problems
[AD-A088073] N80-33138

SPONTANEOUS COMBUSTION
Comparison of coherent and spontaneous Raman combustion diagnostics
[SAND-80-8616] N80-32477

SPRAYED COATINGS
High solids coating system
[AD-A088225] N80-32525

SPREAD F
Some characteristics of spread F at magnetic equatorial station Fortaleza
[INPE-1758-RPE/147] N80-33030
On 11 CM irregularities during equatorial spread F
[AD-A087751] N80-33037

SPREAD SPECTRUM TRANSMISSION
A computer program to analyze spread-spectrum system performance
[AD-A084179] N80-32624

SPUTTERING
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512

SQUID PROJECT
Project SQUID
[AD-A088006] N80-32401

STABILITY
Diocotron instability of a relativistic coaxial multi-ring hollow electron beam
[AD-A088054] N80-33197

STACKS
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007

STAINLESS STEELS
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
Application of analytical electron microscopy to the study of intergranular corrosion in 304 stainless steel
[BNL-27344] N80-32506
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32802
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209

STANDARDIZATION
Universal documentation system handbook. Volume 3: Program support plan and operations directive
[AD-A088222] N80-32415
Methods to insure the standardization of FORTRAN software
[ORNL/CSD/TM-95] N80-33113

STANDARDS
Project fires. Volume 2: Protective ensemble performance standards, phase 1B
[NASA-CR-161530] N80-32586
Environmental assessment. Energy efficiency standards for consumer products
[DOE/CS-0168] N80-32988
Symposium on International Standards Information and ISONET
[PB80-197221] N80-33304

STAR TRACKERS
Combinations of 148 navigation stars and the star tracker
[NASA-TM-82203] N80-32964

STARK EFFECT
Tables of stark level transition probabilities and branching ratios in hydrogen-like atoms
[NASA-TM-82015] N80-33190
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275

STATIC PRESSURE
Wind tunnel investigation of the Titan Forward Skirt compartment vent from a free-stream Mach number of 0.80 to 1.96 --- conducted in the Lewis Research Center 8 by 6 foot supersonic wind tunnel
[NASA-TM-81572] N80-32689
STATIC STABILITY
Heat transfer and static stability tests of the General Purpose Heat Source (GPHS) configurations at Mach 8.0
[AD-A088031] N80-33287
STATISTICAL ANALYSIS
A review and analysis of fiber counting methods
[AD-A088240] N80-32448
Statistical characterization of rough terrain
[AD-A087746] N80-32619
Estimation of the P(CS) with a computer program, revision
[AD-A088058] N80-33108
Ozone data and mission sampling analysis
[NASA-CR-159342] N80-33149
The influence curve and goodness of fit
[AD-A085593] N80-33152
On nearest neighbor degeneracies of indistinguishable particles
[AD-A088247] N80-33155
STATISTICAL CORRELATION
On measuring the conformity of a parameter set to a trend, with applications
[AD-A087946] N80-33133
STATISTICAL DISTRIBUTIONS
The off-line use of a sequential estimator
[AD-A088178] N80-33142
Estimators for the truncated beta-binomial distribution
[CONF-800644-1] N80-33148
Detecting change points in sampling from multinomial distributions
[AD-A087898] N80-33150
Confidence intervals on nonnegative linear combinations of variances
[AD-A084194] N80-33151
STATISTICAL WEATHER FORECASTING
Stepwise linear regression experiments in 14- and 19-day hemispheric weather prediction
[INPE-1757-RPE/146] N80-33049
Atlas of cloud-free line-of-sight probabilities. Part 5: North Africa and the Middle East
[AD-A088156] N80-33089
STEAM
Coal combustion by wet oxidation. Wet oxidation of coal for energy production: Test plan and partial results
[DOE/ET-12328/T1] N80-32474
STEAM TURBINES
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices
[DOE/ET-21050/1-3-VOL-3] N80-32893
STELLAR MASS
Supernova models and light curves
[UCRL-84578] N80-33323
STELLAR RADIATION
Supernova models and light curves
[UCRL-84578] N80-33323
Anomalous isotopic composition of cosmic rays
[UCRL-84561] N80-33335
STEP FUNCTIONS
An algorithm for linearly constrained nonlinear programming problems
[AD-A085458] N80-33127
STEREOPHOTOGRAPHY
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32828
STIFFNESS
Development of procedures for calculating stiffness and damping of elastomers in engineering applications, part 7
[NASA-CR-165138] N80-32718
STIRLING CYCLE
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723
STOCHASTIC PROCESSES
Analysis of nonlinear stochastic systems with wide-band inputs
[AD-A088243] N80-33154
Nonparametric Bayes estimation of distribution functions and the study of probability density estimates
[AD-A088250] N80-33156
Asymptotic conservativeness and efficiency of Kruskal-Wallis test for K dependent samples
[AD-A088249] N80-33157
A robust estimator of the difference between location parameters of correlated variables for fragmentary samples
[AD-A088109] N80-33162
Likelihood ratio tests for and against a stochastic ordering between multinomial populations tests for a stochastic ordering
[AD-A088194] N80-33163
STORAGE BATTERIES
Role of microcomputers in secondary battery development and testing
[UCRL-15171] N80-32903
STORAGE STABILITY
Hydrogeologic effects of natural disruptive events on nuclear waste repositories
[PNL-2858] N80-33206
STRAIN ENERGY METHODS
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033
STRAIN GAGES
A comparison of residual stress measuring techniques: Their strengths and weaknesses
[AD-A088409] N80-32779
STRAIN RATE
Comparison of flow curves of 6061 aluminum alloy at high and low strain rates
[LA-UR-80-1649] N80-32502
Mechanical properties of high-current multifilamentary Nb3Sn conductors
[UCRL-84040] N80-32682
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778
Consistent stress-strain ductile fracture model as applied to two grades of beryllium
[SAND-79-2126] N80-32793
STRATEGY
Optimal strategies for second guessers
[AD-A087897] N80-33124
STRATIFICATION
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33036
STRATIGRAPHY
System for plotting subsoil structure and method therefor
[NASA-CASE-NPO-14191-1] N80-32584
Paleontological resources evaluation: West Divide Project
[PB80-189889] N80-32846
Paleontological resources evaluation: Red Fleet Reservoir
[PB80-204258] N80-32847
STRATOSPHERE
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045
STREAK PHOTOGRAPHY
Circular scan streak tube development
[NASA-CR-160029] N80-33211
STREAMLINING
Selected data from a transonic flexible walled test section
[NASA-CR-159360] N80-32404
STREAMS
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848
STRESS ANALYSIS
An analysis of interlaminar stress gradients and impact damage in graphite-epoxy laminates
[AD-A088317] N80-32446
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
PUFF TOO: A residual stress experiment --- underground explosions
[SAND-79-1674] N80-32788
Approximation of finite element nodal point stresses for nonlinear material models
[K/TS-3798] N80-32791
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792
Consistent stress-strain ductile fracture model as applied to two grades of beryllium
[SAND-79-2126] N80-32793
Finite element stress analysis of a compression mold
[BDX-613-2387] N80-32801
STRESS CONCENTRATION
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748
The method of lines in three dimensional fracture mechanics
[NASA-TM-81593] N80-32753
Interlaminar stress singularities at a straight free edge in composite laminates
[NASA-TM-81876] N80-32754
Solutions of contact problems by the assumed stress hybrid model N80-32771
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787
Approximation of finite element nodal point stresses for nonlinear material models
[K/TS-3798] N80-32791
Development of ultrasonic tomography for residual stress mapping — in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278
STRESS INTENSITY FACTORS
Data controller system for fatigue crack monitoring using a potential drop technique
[MRL-TN-429] N80-32755
Dynamic mixed mode fracture --- stress intensity factors
[AD-A088287] N80-32784
STRESS MEASUREMENT
Using the acoustoelastic effect to measure stress in plates
[UCRL-52914] N80-32799
STRESS-STRAIN DIAGRAMS
Comparison of flow curves of 6061 aluminum alloy at high and low strain rates
[LA-UR-80-1649] N80-32502
STRESS-STRAIN RELATIONSHIPS
On the constitutive laws for the large strain cylindrical deformations of shells
[TAE-370] N80-32750
A proposed generalized constitutive equation for nonlinear para-isotropic materials N80-32769
Inelastic behavior of structural components N80-32773
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140
STRESS-STRAIN-TIME RELATIONS
Long-time creep behavior of the tantalum alloy Astar 811C --- as a function of stress, temperature, and grain size
[NASA-TP-1691] N80-32489
STRONTIUM 90
Environmental Measurements Laboratory
[EML-374] N80-32978
STRUCTURAL ANALYSIS
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425
Developmental studies of constitutive models for plastic-bonded explosives
[LA-8204-MS] N80-32551

Research in nonlinear structural and solid mechanics
[NASA-CP-2147] N80-32756
Nonlinear soil-structure interaction calculations simulating the SIMQUAKE experiment using STEALTH 2D N80-32760
Combustion: Structural interaction in a viscoelastic material N80-32761
Self-adaptive incremental Newton-Raphson algorithms N80-32764
Study of solution procedures for nonlinear structural equations N80-32765
Response of nonlinear panels to random loads N80-32766
Finite element analysis of hyperelastic structures N80-32770
Nonlinear finite element analysis: An alternative formulation N80-32774
THOR: A post-processor for two-dimensional analysis codes
[UCRL-52852] N80-33114

STRUCTURAL DESIGN
Advanced structures maintenance concepts
[AD-A087609] N80-32324
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957

STRUCTURAL DESIGN CRITERIA
Stability optimization of laminated composite plates
[ISAS-579-VOL-45-NO-4] N80-32442

STRUCTURAL ENGINEERING
Dynamic modal estimation using instrumental variables
[NASA-CR-152396] N80-32777
Large Deployable Reflector (LDR)
[NASA-CR-152402] N80-33319

STRUCTURAL MEMBERS
Magnetic field interactions with material discontinuities
[AD-A084541] N80-33171

STRUCTURAL PROPERTIES (GEOLOGY)
Development of a method to detect geologic faults and other linear features from LANDSAT images
[PB80-189665] N80-32844

STRUCTURAL RELIABILITY
Advanced structures concepts r and m/cost assessments --- helicopter airframe maintainability and life cycle costs
[AD-A077373] N80-32374

STRUCTURAL STABILITY
Stability optimization of laminated composite plates
[ISAS-579-VOL-45-NO-4] N80-32442
Parabolic trough solar collector wind loading
[SAND-79-2134C] N80-32895

STRUCTURAL STRAIN
Effects of axisymmetric contractions on turbulence of various scales
[NASA-CR-165136] N80-32328
Theoretical studies of columns under axial impact and experimental verification
[TAE-377] N80-32749

STRUCTURAL VIBRATION
Statistical energy analysis of complex structures, phase 2
[NASA-CR-161576] N80-32752

SUBMARINES
Studies on the removal of carbon monoxide from the atmosphere at ambient temperture --- submarine atmospheres
[AD-A085469] N80-33098

SUBMERGING
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N80-32585

SUBMILLIMETER WAVES
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617

SUBREFLECTORS
Diffraction of a Cassegrain antenna subreflector
[INPE-1827-RPE/193] N80-32613

SUBROUTINES
A minimum excursion-time control system
[AD-A087774] N80-33096
A highly portable data acquisition system for total magnetic field measurements
[AD-A088084] N80-33295

SUBSONIC FLOW
Afterbody drag. Volume 2: Jet interference effects on subsonic boattail drag
[AD-A087515] N80-32342

SUBSONIC SPEED
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389

SUBSTRATES
A bounds on the resonant frequency of rectangular microstrip antennas
[NASA-TM-81882] N80-32609
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876
Low-cost epitaxial techniques for solar-cell fabrication
[SERI/PR-82741-1] N80-32924
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
Sequential purification and crystal growth for the production of low cost silicon substrates
[SERI-8119-3/2] N80-33276

SUGAR BEETS
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818

SUGAR CANE
Production of sugarcane and tropical grasses as a renewable energy source
[DOE-ET-20071/T1] N80-32546

SULFATES
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000

SULFIDES
Detection of hidden mineral deposits by airborne spectral analysis of forest canopies
[PB80-193881] N80-32845

SULFITES
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000

SULFONES
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524

SULFUR
Sulfur modifies the chemisorption of carbon monoxide on rhodium/alumina model catalysts
[AD-A088043] N80-32452
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32866

SULFUR COMPOUNDS
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32866

SULFUR DIOXIDES
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Economic impact of sulfur dioxide and particulate matter regulations in Illinois
[PB80-182645] N80-32992

SULFUR OXIDES
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000

SUN
Solar Maximum Mission
[NASA-TM-82192] N80-33327

SUNFLOWERS
Development of AI procedures for dealing with the effects of episodal events on crop temporal spectral response and development of AI guidelines for corn and soybean labeling --- Corn Belt
[E80-10327] N80-32818

SUPERCONDUCTING MAGNETS
Coupled wave model for large magnet coils
[NASA-CR-3332] N80-32587

SUPERCONDUCTIVITY
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278

SUPERCONDUCTORS
AC losses in type-2 superconductors
[IS-M-280] N80-32679
Mechanical properties of high-current multifilamentary Nb3Sn conductors
[UCRL-84040] N80-32682
Percolation and electrical conduction in superconducting composites
[AD-A088196] N80-33271
A-15 superconducting composites in the 0.1 micron region --- casting alloys for magnet wire
[IS-M-274] N80-33274
Far infrared studies of superconducting V3Si, Nb3Ge, and Nb
[DOE/ER-10436/1] N80-33283

SUPERCRITICAL PRESSURES
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576

SUPERHIGH FREQUENCIES
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625
Derivation of narrowband frequency-agile radar signatures from wideband data analysis of X-band data
[AD-A088376] N80-32631
S and Ku band frequency source development
[NASA-CR-160033] N80-32654

SUPERNOVAE
Supernova models and light curves
[UCRL-84578] N80-33323

SUPERSONIC FLOW
Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332
Computation of three-dimensional supersonic viscous flows in internal corners
[AD-A085857] N80-32345
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33228

SUPERSONIC NOZZLES
Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N80-32392

SUPERSONIC TRANSPORTS
Aircraft air pollution. Citations from the NTIS data base
[PB80-812332] N80-33021

SURFACE ACOUSTIC WAVE DEVICES
Present and future trends in signal processing technologies
[AD-A088085] N80-32634
Nondestructive evaluation of Si wafers using SAW
[AD-A084665] N80-33260

SURFACE EFFECT SHIPS
Air cushion craft development, first revision
[AD-A084740] N80-32592

SURFACE ENERGY
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227

SURFACE FINISHING
RF magnetron sputtering of thick platinum coatings on glass microspheres
[UCRL-83532] N80-32505

SURFACE NAVIGATION
Horizontal datums for nautical charts
[AD-A088340] N80-32839
Saint Lawrence River all-year navigation ice control system
[PB80-183478] N80-32841

SURFACE PROPERTIES
A correlation method to predict the surface pressure distribution of an infinite plate or a body of revolution from which a jet is issuing
[NASA-CR-152345] N80-32339
Liquid surface levitation holography. Part 1: Theoretical
[AD-A088418] N80-32703

Panel report on theory of surfaces
[DOE/ER-01198/1307] N80-33281

SURFACE REACTIONS
Vibrational frequencies of halogen atoms adsorbed on silver metal surfaces
[AD-A087664] N80-32491
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257
Evidence for an oxygen intermediate in the catalytic reduction of NO by CO on rhodium surfaces
[AD-A088045] N80-33265
Panel report on theory of surfaces
[DOE/ER-01198/1307] N80-33281

SURFACE ROUGHNESS
Some aerodynamic considerations related to wind tunnel model surface definition
[NASA-TM-81820] N80-32376
Statistical characterization of rough terrain
[AD-A087746] N80-32619

SURFACE TEMPERATURE
Integral aircraft fuel tank leak classification
[AD-A088168] N80-32388
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823
Further developments of the TELL-US model. 1: An implicit finite difference scheme for the numerical approximation of the ground heat flux. 2: A simple algorithm for estimating the actual and potential evapotranspiration of vegetated surfaces from one remotely sensed surface temperature near the daily maximum
[E80-10333] N80-32824
Numerical simulation of the influence of sea-surface temperature on translating tropical cyclones
[AD-A088050] N80-33067

SURFACE WATER
Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32805
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-32980

SURFACE WAVES
Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040

SURGERY
Radiofrequency lesion generators, a problem definition study
[PB80-191844] N80-33079

SURGES
Coupled wave model for large magnet coils
[NASA-CR-3332] N80-32587

SURVEILLANCE
Development and evaluation of an emissions control decision aid
[AD-A087358] N80-32621

SURVEILLANCE RADAR
An analysis of foliage effects on long-range surveillance
[AD-A088163] N80-32643

SWITCHING CIRCUITS
A study of power and energy in the aurora modification project
[AD-A088051] N80-32637

SYMBOLIC PROGRAMMING
Microcode verification project
[AD-A088189] N80-33110

SYNCHRONOUS SATELLITES
Modelling of environmentally induced discharges in geosynchronous satellites
[NASA-TM-81598] N80-32428
Stereosat: A proposed private sector/government joint venture in remote sensing from space
[NASA-CR-163569] N80-32828

SYNOPTIC METEOROLOGY
Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063

SYNTHANE
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572

SYNTHESIS (CHEMISTRY)
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472
Prepolymer dianhydrides
[NASA-CASE-NPO-13899-1] N80-32515
Synthesis and characterization of new silicone condensation polymers
[UCRL-84304] N80-32530
Alcohol fuels. Citations from the NTIS data base
[PB80-812431] N80-32580
Alcohol fuels. Citations from the Engineering Index data base
[PB80-812456] N80-32582

SYNTHESIZERS
The syntheses of nitrate and nitrite selective polymers
[PB80-195076] N80-32532

SYNTHETIC APERTURE RADAR
Multibeam single frequency synthetic aperture radar processor for imaging separate range swaths
[NASA-CASE-NPO-14525-2] N80-32607

SYNTHETIC FIBERS
Oxidative stabilization of acrylic fibers. Part 5: The decoloration reaction
[AD-A088299] N80-32523

SYNTHETIC FUELS
Synthetic fuels from US oil shales: A technical and economic verification of the HYTORT process
[DOE/ET-14102-2] N80-32567
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570
Synthetic fuels from municipal, industrial and agricultural wastes. Citations from the American Petroleum Institute data base
[PB80-812365] N80-32579
Fusion: An energy source for synthetic fuels
[BNL-27891] N80-33205

SYSTEM FAILURES
Reliability considerations of electronics components for the deep underwater muon and neutrino detection system
[LBL-10548] N80-32744
Laminated, composite flywheel failure analysis
[UCRL-15164] N80-32908

SYSTEMS ANALYSIS
Potential problems relative to TDRS/IUS tilt table elevation with failed VRCS
[NASA-TM-82201] N80-32411
Availability/operational readiness test subsystem cost tradeoffs
[AD-A088201] N80-32743
A methodology for the environmental assessment of advanced coal extraction systems
[NASA-CR-163570] N80-32827
Satellite power system (SPS) concept definition study. Volume 3: Experimental verification definition
[NASA-CR-3320] N80-32860
US National Photovoltaics Program and applications experiments in the intermediate sector
[SAND-80-0587C] N80-32935
Simulation of the energy-industry-environment system for limited economic regions, using the example of Baden-Wuerttemberg. Part 1: Data, model development adaptation
[IKE-K-54-20-PT-1] N80-32974
Evaluation of computing systems using functionals of a Stochastic process
[NASA-CR-163512] N80-33102
Systems assessment of heavy ion beam fusion drivers
[DOE/DP-40039] N80-33247

SYSTEMS ENGINEERING
Titan probe technology assessment and technology development plan study
[NASA-CR-152381] N80-32417
Coal demonstration plants
[DOE/FE-0004/79-2] N80-32555
Redundant motor drive system
[NASA-CASE-MFS-23777-1] N80-32716
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957
Design and implementation of a fiber-optic gamma-measurement system
[UCRL-84109] N80-33219

SYSTEMS SIMULATION
Coal demonstration plants
[DOE/FE-0004/79-2] N80-32555
Study program for encapsulation materials interface for low cost silicon solar array
[NASA-CR-163583] N80-32857
Analytical studies of wind turbine turning characteristics
[RLO/2439-79/3] N80-32951
Creating a science and technology information capacity for the Executive and Legislative Branches of the Delaware State Government
[PB80-190762] N80-33303

T

TABLES (DATA)
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335
Selected data from a transonic flexible walled test section
[NASA-CR-159360] N80-32404
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063
Tables of stark level transition probabilities and branching ratios in hydrogen-like atoms
[NASA-TM-82015] N80-33190

TANKS (CONTAINERS)
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576

TANTALUM
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
Shock compression of tantalum
[AD-A088152] N80-32499

TANTALUM ALLOYS
Long-time creep behavior of the tantalum alloy Astar 811C --- as a function of stress, temperature, and grain size
[NASA-TP-1691] N80-32489

TARGET ACQUISITION
Guidance and control of tactical missiles
[AD-A085147] N80-32422
Advanced pattern-matching techniques for autonomous acquisition
[AD-A087684] N80-33212

TARGET RECOGNITION
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366
Airborne radar approach flight test evaluating various track orientation techniques
[AD-A088426] N80-32368

Target identification using radar imagery and moment methods
[AD-A088514] N80-32630
An analysis of foliage effects on long-range surveillance
[AD-A088163] N80-32643
Comparison of detection performance of selected two-channel algorithms
[AD-A087797] N80-33126
Advanced pattern-matching techniques for autonomous acquisition
[AD-A087684] N80-33212
Reduction and assessment of inf ared background data
[AD-A088241] N80-33218

TARGET SIMULATORS
Multiple Threat Generator (MTG-100)
[AD-A087477] N80-32622

TAXONOMY
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099

TEARING
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792

TECHNOLOGIES
Colorado General Assembly science and technology resource needs assessment study
[PB80-189491] N80-33299

TECHNOLOGY ASSESSMENT
Titan probe technology assessment and technology development plan study
[NASA-CR-152381] N80-32417
Technological innovation in the design and development of the space transportation system
[NASA-TM-82190] N80-32423
Space Shuttle press conference --- space transportation system 1 flight status
[NASA-TM-82191] N80-32424
California's biomass and its energy potential
[LBL-10058] N80-32564
Assessment of Synthane mechanical equipment
[MTI-79TR5] N80-32572
Application of image intensifier technology to the military, scientific, industrial, educational, and medical communities
[AD-A088165] N80-32676
Potential of spark ignition engine, 1979 summary source document
[PB80-191034] N80-32737
Mini arc welding/brazing technique
[PB80-186497] N80-32739
Use of solar energy to produce process heat for industry
[SERI/TP-731-626] N80-32863
Residential photovoltaic flywheel storage system performance and cost
[DOE/ET-20279/92] N80-32874
Reference energy systems as applied to regional energy policy
[BNL-26987] N80-32883
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891
Costing methodologies for energy systems
[BNL-27603] N80-32900
Assessment of hydrogen compressor technology for energy storage and transmission systems
[ORO-5598-T1] N80-32922
Forecasts of energy technology. Citations from the International Aerospace Abstracts data base
[NASA-CR-163596] N80-32965
Assessment of environmental control technologies for energy storage systems, 1979
[LA-8308-MS] N80-32973
Environmental assessment report: Wellman-Galusha low-Btu gasification systems
[PB80-190796] N80-32995

TECHNOLOGY TRANSFER
Use of scientific and technical information and advice by the California legislature: A survey of current policies and proposals for improvements
[PB80-189095] N80-33305
Applying scientific and technological resources for North Dakota policy development: State Science, Engineering and Technology program
[PB80-189624] N80-33306
The State Science, Engineering and Technology program in North Carolina, study phase
[PB80-190846] N80-33307
Manufacturing process applications team (MATeam)
[NASA-CR-161577] N80-33313

TECHNOLOGY UTILIZATION
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
Application of image intensifier technology to the military, scientific, industrial, educational, and medical communities
[AD-A088165] N80-32676
Energy conservation via heat transfer enhancement
[COO-4649-10] N80-32906
Colorado General Assembly science and technology resource needs assessment study
[PB80-189491] N80-33299
Developing science and technology resources for the Governor, of the Ohio Science, Engineering and Technology Program for executive agencies
[PB80-190101] N80-33300
The Science, Engineering, and Technology Program for the New Jersey Executive Branch
[PB80-190242] N80-33301
Manufacturing process applications team (MATeam)
[NASA-CR-161577] N80-33313

TECTONICS
Regional analysis of earthquake occurrence and seismic energy release
[NASA-TM-81994] N80-33033

TEFLON (TRADEMARK)
A study of transient ablation of blunt bodies
[ISAS-561-VOL-45-NO-6] N80-32331

TELECOMMUNICATION
A quantitative analysis of inter-island telephony traffic in the Pacific Basin Region (PBR)
[NASA-TM-81587] N80-32610
Voice communication research evaluation system
[AD-A088100] N80-32635

TELEMETRY
Seasat-A land applications data processing plan
[E80-10317] N80-32810

TELEPHONY
Transmission of 565 Mbit/s signals via coaxial cables
[BLL-RDL-TRANS-3793-(7737.470)] N80-32606

TELEVISION SYSTEMS
Satellite Instructional Television Experiment. Television comes to village: An evaluation of SITE
[ISRO-SAC-TR-09-78] N80-32611

TEMPERATURE
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066

TEMPERATURE CONTROL
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2689-T4] N80-32543
Magnetic refrigeration for space applications
[LA-UR-80-1566] N80-32596
Fluid temperature control for parabolic trough solar collectors
[SAND-79-2006C] N80-32894

TEMPERATURE DEPENDENCE
Composition and temperature dependence of shear viscosity of hydrocarbon mixtures
[AD-A088236] N80-32459
Long-time creep behavior of the tantalum alloy Astar 811C --- as a function of stress, temperature, and grain size
[NASA-TP-1691] N80-32489
A survey of current temperature dependent elastic-plastic-creep constitutive laws for applicability to finite element computer codes
[AD-A088375] N80-32780

TEMPERATURE DISTRIBUTION
Apparatus for supplying conditioned air at a substantially constant temperature and humidity
[NASA-CASE-GSC-12191-1] N80-32583
Thermographic techniques applied to solar collector systems analysis
[SERI/TP-351-540] N80-32946

TEMPERATURE EFFECTS
Integral aircraft fuel tank leak classification
[AD-A088168] N80-32388
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
Thermally stimulated discharge current analysis of epoxy resins
[AD-A088213] N80-32526
Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600
Design evolution and verification of the general-purpose heat source --- for spacecraft power systems
[DOE/ET-33021/T1] N80-32930
Ion chemistry in interstellar space
[NASA-CR-163580] N80-33188
Far infrared studies of superconducting V3Si, Nb3Ge, and Nb
[DOE/ER-10436/1] N80-33283

TEMPERATURE GRADIENTS
Thermal characteristics of Discharge-heated Cooper Vapor Laser (DHCVL) heat shields formed of multiple coaxial cylinders
[UCRL-83649] N80-32714
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822

TEMPERATURE INVERSIONS
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778

TEMPERATURE MEASUREMENT
New instrumentation for temperature measurement. Phase 1: Program solicitation, small business innovation research
[PB80-184682] N80-32705
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
On the inference of oceanic currents or eddies by spaceborne altimetry through the dynamic method for the determination of three dimensional density (temperature) field
[AD-A088082] N80-33076

TEMPERATURE PROBES
New instrumentation for temperature measurement. Phase 1: Program solicitation, small business innovation research
[PB80-184682] N80-32705

TEMPERATURE PROFILES
Model of direct contact heat transfer for latent heat energy storage
[SERI/TP-631-587] N80-32955
Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057

TEMPERATURE SENSORS
New instrumentation for temperature measurement. Phase 1: Program solicitation, small business innovation research
[PB80-184682] N80-32705
Remote sensing applied to the prospecting of geothermal anomaly in Caldas Novas County, State of Goias, Brazil
[INPE-1792-RPE/164] N80-32837

TENSILE PROPERTIES
Creep-rupture behavior of seven iron-base alloys after long term aging at 760 deg in low pressure hydrogen
[NASA-TM-81534] N80-32488
Microstructure and tensile properties of heavily irradiated 5052-0 aluminum alloy
[CONF-800609-3] N80-32511

TENSILE STRESS
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444

TENSILE TESTS
Comparison of flow curves of 6061 aluminum alloy at high and low strain rates
[LA-UR-80-1649] N80-32502
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600

Weld overlaying for corrosion resistance in coal gasification atmospheres
[FE-2621-13] N80-32726

TERMINAL BALLISTICS
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535

TERMINAL CONFIGURED VEHICLE PROGRAM
Flight performance of the TCV B-737 airplane at Montreal/Dorval International Airport, Montreal, Canada, using TRSB/MLS guidance
[NASA-TM-81885] N80-32361

TERRAIN ANALYSIS
Statistical characterization of rough terrain
[AD-A087746] N80-32619
Terrain scatter parameter model --- detection of low flying aircraft
[AD-A084248] N80-32626

TEST FACILITIES
Design concept for fuel fire facility scale-down
[AD-A084624] N80-32406
Voice communication research evaluation system
[AD-A086100] N80-32635

TEST FIRING
Investigation of fuels containing coal-oil-water emulsions fire tube test apparatus design and construction
[FE-2689-T4] N80-32543

TEXTURES
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840

THEMATIC MAPPING
Planning and execution of a photographic mission over a wheat producing region in Rio Grande do Sul, Brazil
[INPE-1793-RPE/165] N80-32833

THERMAL ABSORPTION
A study of transient ablation of blunt bodies
[ISAS-581-VOL-45-NO-6] N80-32331

THERMAL CONDUCTIVITY
Thermal conductivity of consolidated Al/Cu2O thermites
[MLM-2698] N80-32503
Support assembly for cryogenically coolable low-noise choke waveguide
[NASA-CASE-NPO-14253-1] N80-32605

THERMAL CONTROL COATINGS
Satellite spacecraft charging control materials
[AD-A087675] N80-32420

THERMAL CYCLING TESTS
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512

THERMAL DEGRADATION
Determination of kinetic parameters for thermal decomposition of phenolic ablative materials by multiple heating rate method
[AD-A087929] N80-32443

THERMAL DISSOCIATION
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469

THERMAL ENERGY
Numerical solutions for steady thermal convection from a concentrated source in a porous medium
[SAND-79-2214] N80-32698
Thermal energy storage for building heating and cooling applications
[ORNL-TM-7319] N80-32879
Line-focus solar thermal energy technology development. Report for Department 4720
[SAND-80-0865-REV] N80-32887
Potential for supplying solar thermal energy to industrial unit operations
[SERI/TP-632-584] N80-32911
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942

THERMAL EXPANSION
Performance of two-layer thermal barrier systems on directionally solidified Ni-Al-Mo and comparative effects of alloy thermal expansion on system life
[NASA-TM-81604] N80-32487

THERMAL MAPPING
Infrared-temperature variability in a large agricultural field --- Dunnigan, California
[E80-10331] N80-32822
On extracting brightness temperature maps from scanning radiometer data --- techniques for algorithm design
[NASA-TM-81989] N80-32838

THERMAL RADIATION
Thermal radiation analysis system TRASYS 2: User's manual
[NASA-CR-159273-1] N80-32690
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691
One millimeter continuum observations of extragalactic thermal sources
[NASA-CR-163590] N80-33334

THERMAL STABILITY
Investigation of fatigue failure in bituminous base mixes
[PB80-188006] N80-32600

THERMAL STRESSES
Envrionmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416

THERMIONIC DIODES
A computer model of solar pariel-plasma interactions
[NASA-CR-160796] N80-32853

THERMIONIC POWER GENERATION
Optimal thermionic energy conversion with established electrodes for high-temperature topping and process heating --- coal combustion product environments
[NASA-TM-81555] N80-33221

THERMODYNAMIC EFFICIENCY
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467
Thermochemical water-splitting cycle, bench-scale investigations and process engineering
[GA-A-15788] N80-32469
Reduction of fuel consumption by thermodynamic optimization of the Otto motor: Comparative investigation of Otto diesel engines
[EUR-6711-DE] N80-32733
Analytical prediction of the performance of an air photovoltaic/thermal flat plate collector
[DOE/ET-20279/93] N80-32914

THERMODYNAMIC PROPERTIES
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534
Thermodynamic properties of Liquefied Petroleum Gases (LPG)
[PB80-189053] N80-32575
The calculation of the thermodynamic properties of propane, propylene, N-butane, and ethylene
[PB80-189061] N80-32576
Thermodynamic properties of solid helium using an anharmonic anisotropic continuum model
[DOE/ER-01198/1314] N80-32598

THERMODYNAMICS
Comparative thermal analysis of alternate Cryogenic Fluid Management Experiment (CFME) configurations
[NASA-CR-165151] N80-32412
Relevance of the second law of thermodynamics to energy conservation
[DOE/CS-40178/01-VOL-1] N80-33288

THERMOMAGNETIC COOLING
Magnetic refrigeration for space applications
[LA-UR-80-1566] N80-32596

THERMONUCLEAR REACTIONS
Fusion reactors for hydrogen production via electrolysis
[BNL-27782] N80-32559
A diverted plasma reversed field pinch
[AD-A088049] N80-33225

THERMOPLASTIC RESINS
Fracture testing of injection molded glass and carbon fiber reinforced thermoplastics
[MIT-CE-R79-4] N80-32438

THERMOSETTING RESINS
Toughening of thermosetting polyimides
[NASA-CR-163594] N80-32517

THETA PINCH
Numerical modelling of an end-plugged theta pinch
[MSNW-80-1146-2] N80-33231
Theory of field-reversed mirrors and field-reversed plasma-gun experiments
[UCRL-83518] N80-33235
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243
Compact torus experiments and theory
[LA-UR-80-1826] N80-33249

THIN FILMS
Filter development for the extreme ultraviolet explorer
[NASA-CR-160039] N80-32418
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444
Electroluminescent display technology
[AD-A085641] N80-32663
High contrast electroluminescent readout device
[AD-A088237] N80-32673
High contrast electroluminescent numeric readout device
[AD-A088238] N80-32674
Power ratings of rf thin film resistive attenuators
[BDX-613-2404] N80-32683
Automatic visual inspection of hybrid microcircuits
[BDX-613-2359] N80-32747
CdSiAs2 thin films for solar cell applications
[DOE/ET-23007/1] N80-32919
Amorphous thin films for solar-cell applications
[DOE/ET-21074/4] N80-32921
Photovoltaic mechanisms in polycrystalline thin-film silicon solar cells
[DOE/ET-23108/2] N80-32923
Electrochemical photovoltaic cells cdSe thin film electrodes
[DSE-4042-T16] N80-32925
Development of copper sulfide/cadmium sulfide thin film solar cells
[DSE-4042-T42] N80-32931
Thin films of silicon on metallurgical silicon substrates
[SAN-1285-T2] N80-32933
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214
Optical coatings for laser fusion applications
[UCRL-83582] N80-33238
Crystalline silicon on insulators by graphoepitaxy --- laser crystallization
[AD-A085435] N80-33257

THIN PLATES
Recent advances in the edge-function method 1979-1980
[AD-A088328] N80-33140

THOMSON SCATTERING
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243

THREE DIMENSIONAL FLOW
Computation of three-dimensional supersonic viscous flows in internal corners
[AD-A085857] N80-32345
Theoretical and experimental investigation of coherent structure in the turbulent boundary layer
[AD-A088248] N80-32696
FLUOMEG: A planar finite difference mesh generator for fluid flow problems with parallel boundaries
[ORNL/TM-7115] N80-32697

TIMBER IDENTIFICATION
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826

TIME DEPENDENCE
A linear response theory approach to time-resolved fluorimetry
[AD-A088211] N80-32461
Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

TIME LAG
Dynamic modal estimation using instrumental variables
[NASA-CR-152396] N80-32777

Using the acoustoelastic effect to measure stress in plates
[UCRL-52914] N80-32799

TIME OF FLIGHT SPECTROMETERS
Use of an automated mass spectrometer for an underground coal gasification field test
[UCRL-84366] N80-32565

TIME SERIES ANALYSIS
Some graphical considerations in time series analysis
[AD-A088246] N80-33131
Deciding on the best (in this case) approach to time-series forecasting
[CONF-800571-1] N80-33165

TIME SIGNALS
GPS NAVSTAR-4 and NTS-2 long term frequency stability and time transfer analysis
[AD-A088092] N80-32370

TIMOSHENKO BEAMS
Computational models for the nonlinear analysis of reinforced concrete plates N80-32758

TIROS N SATELLITE
APT 80-1 technical notes
[INPE-1845-NTE/162] N80-32419
High resolution infrared radiation sounder/mod 2 (HIRS/2)
[NASA-CR-160030] N80-33055

TITAN
Titan probe technology assessment and technology development plan study
[NASA-CR-152381] N80-32417

TITAN CENTAUR LAUNCH VEHICLE
Wind tunnel investigation of the Titan Forward Skirt compartment vent from a free-stream Mach number of 0.80 to 1.96 --- conducted in the Lewis Research Center 8 by 6 foot supersonic wind tunnel
[NASA-TM-81572] N80-32689

TITANATES
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278

TOKAMAK DEVICES
Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222
Electron cyclotron/upper hybrid resonant preionization in the ISX-b Tokamak
[AD-A088086] N80-33226
Heating at the electron cyclotron frequency in the ISX-b Tokamak
[AD-A088087] N80-33227
Tokamak heating and current maintenance with intense pulsed ion beams
[AD-A088274] N80-33230
Tokamak poloidal field systems
[LA-8375-PR] N80-33233
Large aspect ratio Tokamak study
[ORNL/TM-7278] N80-33239

TOMOGRAPHY
System for plotting subsoil structure and method therefor
[NASA-CASE-NPO-14191-1] N80-32584
Development of ultrasonic tomography for residual stress mapping --- in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798

TOPOGRAPHY
Vertical velocity forced by topography in the Southern Hemisphere
[INPE-1691-RPE/119] N80-33052
Coordinates of features on the Galilean satellites
[NASA-CR-163582] N80-33326

TOPOLOGY
Semistable laws on topological vector spaces
[AD-A088224] N80-33143
On the almost sure convergence of weighted sums of random elements in D(0, 1)
[AD-A088330] N80-33144

TOROIDAL DISCHARGE
Initial reversed-field pinch experiments on ZT-40 and recent advances in RFP theory
[LA-UR-80-1834] N80-33248

TOROIDAL PLASMAS
Parametric instabilities of electron cyclotron waves in plasmas
[AD-A087742] N80-33222
Reversed-field pinch fusion reactor
[LA-UR-80-1494] N80-33246

TOROIDS
Tokamak heating and current maintenance with intense pulsed ion beams
[AD-A088274] N80-33230
Compact torus experiments and theory
[LA-UR-80-1826] N80-33249

TOXIC HAZARDS
Radiant panel tests on an epoxy/carbon fiber composite
[NASA-TM-81185] N80-32435

TOXICITY AND SAFETY HAZARD
Development of analytical techniques for toxicokinetic research
[AD-A077729] N80-33080

TOXICOLOGY
The effect of designated pollutants on plant species
[AD-A078933] N80-32969
Ecosystem theory and the unexpected: Implications for environmental toxicology
[CONF-800376-1] N80-32975

TRACE CONTAMINANTS
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848

TRACE ELEMENTS
Comparison of tracer methods and predictive equations for determination of stream-reaeration coefficients on three small streams in Wisconsin
[PB80-193642] N80-32848
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993

TRACKING (POSITION)
Comparison of detection performance of selected two-channel algorithms
[AD-A087797] N80-33126

TRACKING RADAR
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366
Airborne radar approach flight test evaluating various track orientation techniques
[AD-A088426] N80-32368

TRACKING STATIONS
Collection, processing, and distribution of remote sensing data from Brazilian Receiving Station
[INPE-1784-RPE/156] N80-32832

TRAFFIC
Pavement and geometric design criteria for minimizing hydroplaning. A technical summary
[PB80-190457] N80-32603

TRAILERS
Improved low-drag ground vehicle particularly suited for use in safely transporting livestock
[NASA-CASE-FRC-11058-1] N80-33312

TRAJECTORY MEASUREMENT
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366

TRANSFER FUNCTIONS
Liquid surface levitation holography. Part 1: Theoretical
[AD-A088418] N80-32703

TRANSFERRING
Investigation of mechanisms of hydrogen transfer in coal hydrogenation, phase 2
[FE-2305-30] N80-32568

TRANSFORMATIONS (MATHEMATICS)
More on approximations of Poisson probabilities
[BNL-27878] N80-33164

TRANSFORMERS
Evaluation of advanced technologies for power transformers, part 1
[DOE/RA-2134/01] N80-32678
Evaluation of alternative insulating oils for use in transformers and other electrical apparatus: Characteristics of insulating oils for electrical application
[EPRI-EL-809-SY] N80-32680
Characteristics of insulating oil for electrical application
[EPRI-EL-1300] N80-32681

TRANSIENT RESPONSE
Calculation of the transient motion of elastic airfoils forced by control surface motion and gusts
[NASA-TM-81351] N80-32329
Transient ignition mechanisms of confined solid propellants under rapid pressurization
[AD-A088080] N80-32539

TRANSITION METALS
Interatomic forces in solid and liquid transition metals
[AD-A087672] N80-32492
Light induced electron transfer reactions of metal complexes
[BNL-28043] N80-33277

TRANSITION PROBABILITIES
Tables of stark level transition probabilities and branching ratios in hydrogen-like atoms
[NASA-TM-82015] N80-33190

TRANSMISSION LINES
A study of power and energy in the aurora modification project
[AD-A088051] N80-32637

TRANSMISSION LOSS
AC losses in type-2 superconductors
[IS-M-280] N80-32679

TRANSMITTANCE
Atmospheric transmittance/radiance: Computer code LOWTRAN 5
[AD-A088215] N80-33042

TRANSONIC FLIGHT
Transonic pitch damping of a delta wing aircraft determined from flight measurements
[AD-A087771] N80-32381

TRANSONIC FLOW
Theoretical calculation of viscous-inviscid transonic flows
[AD-A087745] N80-32348
Computational and simplified analytical treatment of transonic wing-fuselage-pylon-store interactions
[AD-A085619] N80-32383
Unsteady transonic flows in a two-dimensional diffuser
[AD-A088231] N80-32400

TRANSONIC SPEED
Interaction between a normal shock wave and a turbulent boundary layer at high transonic speeds. Part 1: Pressure distribution. Part 2: Wall shear stress. Part 3: Simplified formulas for the prediction of surface pressures and skin friction
[NASA-CR-3194] N80-32323
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389

TRANSONIC WIND TUNNELS
Modeling and control of transonic cryogenic wind tunnels
[NASA-CR-163588] N80-32403

TRANSPORT AIRCRAFT
Study of an advanced transport airplane design concept known as Flatbed
[NASA-CR-159337] N80-32377
Study of methane fuel for subsonic transport aircraft
[NASA-CR-159320] N80-32533
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309

TRANSPORT PROPERTIES
Microcosms as potential screening tools for evaluating transport and effects of toxic substances
[ORNL/EPA-4] N80-32979

TRANSPORTATION ENERGY
California's biomass and its energy potential
[LBL-10058] N80-32564

TRANSPORTER
Electrostatic levitation and transport of laser fusion targets
[UCRL-83981] N80-33245

TRANSVERSE WAVES
Matrix theory of elastic wave scattering: Application to scattering of transverse waves
[UCRL-84116] N80-32649

TRAPPED MAGNETIC FIELDS
Study of flow and loss processes at the ends of a linear theta pinch
[COO-4020-10] N80-33243

TRAVELING IONOSPHERIC DISTURBANCES
Wave disturbances in the low latitude ionosphere and equatorial ionosphere plasma depletions
[INPE-1806-RPE/174] N80-33027
Gravity wave induced ionization layers in the night F-region at low latitudes
[INPE-1759-RPE/148] N80-33028

Some characteristics of spread F at magnetic equatorial station Fortaleza
[INPE-1758-RPE/147] N80-33030

TRAVELING WAVE TUBES
Variational analysis of helical slow wave structures
[AD-A087478] N80-32659
Advanced AN/TPQ-37 transmitter tube
[AD-A088235] N80-32675

TRAVELING WAVES
Variational analysis of helical slow wave structures
[AD-A087478] N80-32659

TRINITROTOLUENE
Sensitivity of molten and solid TNT charges to impact by primary steel fragments
[AD-A087750] N80-32535
Studies of fast reactions in detonations
[LA-UR-80-1282] N80-32550

TRIVALENT IONS
A study of secondary ion triple bond analogues
[AD-A088423] N80-33262

TROPICAL REGIONS
The microclimate of a tropical evergreen forest
[AD-A088059] N80-33066
Numerical simulation of the influence of sea-surface temperature on translating tropical cyclones
[AD-A088050] N80-33067

TROPICAL STORMS
An atlas of 1977 and 1978 GEOS-3 radar altimeter data for tropical cyclone studies
[NASA-TM-73288] N80-33046

TROPOSPHERE
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045
A climatological study of the tropospheric circulation over the Amazon region
[INPE-1761-RPE/150] N80-33050

TRUCKS
Potential of diesel engine, 1979 summary source document
[PB80-193659] N80-32734
Improved low-drag ground vehicle particularly suited for use in safely transporting livestock
[NASA-CASE-FRC-11058-1] N80-33312

TTL INTEGRATED CIRCUITS
Radiation evaluation study of LSI RAM technologies
[AD-A084168] N80-32660
Integrated circuit design of a video reconstructor for a range-gated moving target indicator
[AD-A084376] N80-32661

TUNGSTEN
New concept for a high-power beam dump
[UCRL-83696] N80-33208

TURBINE BLADES
Low cost process for manufacturing of Oxide Dispersion Strengthened (ODS) turbine nozzle components
[AD-A088019] N80-32399
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570

TURBINE PUMPS
A study on various methods of supplying propellant to an orbit insertion rocket engine
[TRW/DSSG-36358.001] N80-32413

TURBINES
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570
Development of procedures for calculating stiffness and damping of elastomers in engineering applications, part 7
[NASA-CR-165138] N80-32718
UTRC 8 kW wind turbine tests
[RFP-3085] N80-32722

TURBOFAN ENGINES
Effects of axisymmetric contractions on turbulence of various scales
[NASA-CR-165136] N80-32328
Performance deterioration of commercial high-bypass ratio turbofan engines
[NASA-TM-81552-REV] N80-32394
The energy efficient engine project
[NASA-TM-81566] N80-32395

TURBOGENERATORS
High-temperature turbine technology program. Overall Plant Design Description (OPDD) coal-derived liquid
[FE-1806-84] N80-32728
High-temperature turbine technology program. Overall Plant Design Description (OPDD) low-Btu coal gas electric power plant
[FE-1806-83] N80-32729
Large wind turbines: A utility option for the generation of electricity
[NASA-TM-81502] N80-32858
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942

TURBOMACHINERY
Development of flexible rotor balancing criteria
[NASA-CR-159506] N80-32720

TURBOPROP ENGINES
Application of advanced technologies to small, short-haul transport aircraft
[NASA-CR-152363] N80-32353
NASA authorization, 1980, volume 2, part 2
[GPO-45-070] N80-33309

TURBULENCE
Boundary-layer flow on an axisymmetric body with an inflected stern
[AD-A088526] N80-32695

TURBULENT BOUNDARY LAYER
Interaction between a normal shock wave and a turbulent boundary layer at high transonic speeds. Part 1: Pressure distribution. Part 2: Wall shear stress. Part 3: Simplified formulas for the prediction of surface pressures and skin friction
[NASA-CR-3194] N80-32323
Theoretical and experimental investigation of coherent structure in the turbulent boundary layer
[AD-A088248] N80-32696

TURBULENT FLOW
Effects of axisymmetric contractions on turbulence of various scales
[NASA-CR-165136] N80-32328
Theoretical and experimental investigation of coherent structure in the turbulent boundary layer
[AD-A088248] N80-32696
Two-photon excitation of nitric oxide fluorescence as a temperature indicator in unsteady gas-dynamic processes
[NASA-TM-81220] N80-32700

TURBULENT MIXING
Chemical reactions in turbulent mixing
[AD-A088529] N80-32694

TWO DIMENSIONAL FLOW
Unsteady transonic flows in a two-dimensional diffuser
[AD-A088231] N80-32400
FLUOMEG: A planar finite difference mesh generator for fluid flow problems with parallel boundaries
[ORNL/TM-7115] N80-32697

U

ULTRAHIGH FREQUENCIES
Low sidelobe S-band line source array
[AD-A087651] N80-32616
Dice throw UHF/SHF transmission experiment. Volume 3: Final data reduction and interpretation
[AD-A085760] N80-32625
S and Ku band frequency source development
[NASA-CR-160033] N80-32654

ULTRASONIC TESTS
Elastic wave propagation through multilayered media
[AD-A088030] N80-32636
Weld evaluation on spherical pressure vessels using holographic interferometry
[UCRL-84079] N80-32745
Development of ultrasonic tomography for residual stress mapping --- in nuclear reactor safety evaluation
[EPRI-NP-1407] N80-32798
Using the acoustoelastic effect to measure stress in plates
[UCRL-52914] N80-32799

ULTRAVIOLET RADIATION
Filter development for the extreme ultraviolet explorer
[NASA-CR-160039] N80-32418
Optical coatings for laser fusion applications
[UCRL-83582] N80-33238

ULTRAVIOLET SPECTROPHOTOMETERS
Photographic spectroscopic measurement of ultraviolet solid rocket motor plumes
[AD-A088438] N80-32434

ULTRAVIOLET SPECTROSCOPY
XUV aluminum spectra of laser-produced plasmas
[AD-A088107] N80-33223

UNDERGROUND EXPLOSIONS
PUFF TOO: A residual stress experiment --- underground explosions
[SAND-79-1674] N80-32788

UNDERGROUND STORAGE
Hydrogeologic effects of natural disruptive events on nuclear waste respositories
[PNL-2858] N80-33206

UNIQUENESS THEOREM
A collinear N-body problem of classical electrodynamics
[AD-A088114] N80-32456
A uniqueness theorem for ordinary differential equations
[AD-A088113] N80-33137

UNITED KINGDOM
HCMM satellite follow-on investigation no. 025: Soil moisture and heat budget evaluation in selected European zones of agricultural and environmental interest (TELLUS Project) --- France, Germany, Italy, United Kingdom, and the Benelux countries
[E80-10332] N80-32823

UNITED STATES OF AMERICA
Comparison of changes in the ionospheric total electron content at mid-latitude locations few hundred kilometers apart
[INPE-1798-RPE/168] N80-33029

UPPER ATMOSPHERE
Simultaneous measurements of OH(9,4), (8,3), (7,2), (6,2) and (5,1) bands in the airglow
[INPE-1801-RPE/171] N80-33032
Data processing support for experimental studies of the upper atmosphere
[AD-A087943] N80-33034

UPPER IONOSPHERE
Some characteristics of spread F at magnetic equatorial station Fortaleza
[INPE-1758-RPE/147] N80-33030

UPPER STAGE ROCKET ENGINES
Envrionmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416

UPPER SURFACE BLOWING
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347
Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382

URANIUM
Geometric pattern recognition techniques applied to land LANDSAT digital data for uranium exploration
[GJBX-26(80)] N80-32840

URBAN DEVELOPMENT
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316

URBAN PLANNING
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942
Data resources in housing and urban development
[PB80-188071] N80-33302

URINALYSIS
Development of analytical techniques for toxicokinetic research
[AD-A077729] N80-33080

USER MANUALS (COMPUTER PROGRAMS)
Helicopter dynamic performance program. Volume 2: User's manual
[AD-A088318] N80-32387
National Aviation Fuel Scenario Analysis Program (NAFSAP). Volume 1: Model description. Volume 2: User manual
[AD-A084235] N80-32537
Thermal radiation analysis system TRASYS 2: User's manual
[NASA-CR-159273-1] N80-32690
Thermal radiation analysis system TRASYS 2. Appendix H: User's manual
[NASA-CR-159273-2] N80-32691
User's manual for the vertical axis wind turbine performance computer code darter
[SAND-80-1155] N80-32872
User's manual for hydrological simulation program: FORTRAN (HSPF)
[PB80-191109] N80-33004
Advanced SMITE reference manual
[AD-A087743] N80-33106
THOR: A post-processor for two-dimensional analysis codes
[UCRL-52852] N80-33114
Remote hard copy. Volume 1: Programming manual
[SAND-80-0538/1] N80-33298

UTAH
Paleontological resources evaluation: Red Fleet Reservoir
[PB80-204258] N80-32847

UTILITIES
Economics of shale oil production by radio frequency heating
[UCRL-52942] N80-32566
District heating and cooling systems for communities through power plant retrofit distribution network, volume 4
[COO-4977/1-VOL-4] N80-32942

V

V/STOL AIRCRAFT
Investigation of transient induced aerodynamics in a moving deck environment
[AD-A088164] N80-32350
Conceptual study of modifying an existing fighter for V/STOL capability and combat maneuvering enhancement
[AD-A087657] N80-32380

VACUUM DEPOSITION
Research on Cu sub x S/(cd, Zn)S photovoltaic solar energy converters
[LBL-10791] N80-32927

VALLEYS
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071

VALVES
Advanced microbial check valve development
[NASA-CR-163577] N80-33094

VANADATES
Crystal growth by skull melting
[AD-A088013] N80-33269

VANADIUM OXIDES
Electron paramagnetic resonance spectroscopy of vanadium (IV) complexes and related species
[AD-A088311] N80-32458

VAPOR DEPOSITION
Coatings for graphite fibers
[NASA-CR-159304] N80-32439

VARIABLE GEOMETRY STRUCTURES
Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N80-32392

VARIABLE STARS
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320

VARIATIONAL PRINCIPLES
Variational analysis of helical slow wave structures
[AD-A087478] N80-32659

VECTOR SPACES
A zero-one law for a class of measures on groups
[AD-A088374] N80-33130
Semistable laws on topological vector spaces
[AD-A088224] N80-33143
Supralgebras, supergroups and geometric gauging
[ORO-3992-384] N80-33169

VECTORS (MATHEMATICS)
A mixed bonding band structure calculation for GAs and AlAs, using the APW-k vector p vector method
[INPE-1762-RPE/151] N80-33253

VEGETABLES
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815

VEGETATION
Evaluation of remote sensing techniques on selected forest sites in Florida --- Fort Myers and Gainesville test sites
[E80-10296] N80-32805
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Using LANDSAT digital data for estimating green biomass --- Throckmorton, Texas test site and Great Plans Corridor, US
[E80-10328] N80-32819
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825
Application of remote sensing to state and regional problems --- Mississippi
[E80-10338] N80-32826
Characterization of Cerrado vegetation using automatically classified LANDSAT MSS data
[INPE-1790-RPE/162] N80-32835

VEGETATION GROWTH
The applicability of remote sensing to Earth biological problems. Part 2: The potential of remote sensing in pest management
[NASA-CR-163589] N80-32830
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32836

VELOCITY MEASUREMENT
Shock compression of tantalum
[AD-A088152] N80-32499
Chemical reactions in turbulent mixing
[AD-A088529] N80-32694
Plastic deformation of colliding hemishells
[LA-UR-80-1659] N80-32794
Technique for the generation of pressure-shear loading using anisotropic crystals
[SAND-80-1301C] N80-32795
Application of a photodiode-array optical turbulence sensor to wind studies in complex terrain
[UCRL-84503] N80-33074

VENTILATION
Effects of energy-efficient ventilation rates on indoor air quality at an Ohio elementary school
[LBL-10223] N80-32595
Occupant-generated CO2 as an indicator of ventilation rate
[LBL-10496] N80-32984

VENTS
Wind tunnel investigation of the Titan Forward Skirt compartment vent from a free-stream Mach number of 0.80 to 1.96 --- conducted in the Lewis Research Center 8 by 6 foot supersonic wind tunnel
[NASA-TM-81572] N80-32689

VENTURI TUBES
TI-59 programmable calculator programs for in-stack opacity, venturi scrubbers, and electrostatic precipitators
[PB80-193147] N80-33007

VENUS SURFACE
Surface of Venus from Pioneer
[NASA-TM-82193] N80-33324

VERTICAL AIR CURRENTS
Airborne measurements of stratospheric ozone intrusions into the troposphere over the United States. Volume 1: Data analysis and interpretation
[PB80-185788] N80-33045

VERTICAL DISTRIBUTION
Vertical velocity forced by topography in the Southern Hemisphere
[INPE-1691-RPE/119] N80-33052

VERTICAL TAKEOFF
Investigation of transient induced aerodynamics in a moving deck environment
[AD-A088164] N80-32350

VIBRATION
The effect of vibration on quartz crystal resonators
[AD-A085642] N80-32677
Vibration resistant quartz crystal resonators
[AD-A088286] N80-33268

VIBRATION ISOLATORS
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786

VIBRATION MEASUREMENT
Development of cellulose flywheel rotors
[SAND-79-7099] N80-32882

VIBRATION TESTS
Mated vertical ground vibration test
[NASA-TM-78298] N80-32425

VIBRATIONAL SPECTRA
Vibrational spectra of carbon monoxide chemisorbed on alumina-supported nickel particles: A tunneling spectroscopy study
[AD-A088044] N80-32453
The application of high resolution electron energy loss spectroscopy to the study of model supported metal catalysts
[AD-A088118] N80-32457
Observation of an optical stark effect on vibration and rotational transitions
[SAND-80-8707] N80-33275

VIDEO EQUIPMENT
Integrated circuit design of a video reconstructor for a range-gated moving target indicator
[AD-A084376] N80-32661
A human engineering specification for legibility of alphanumeric symbology on video monitor displays
[AD-A088470] N80-33100

VINEYARDS
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815

VINYL COPOLYMERS
Structure-property relationships of linear methyl-phenyl-vinyl siloxane terpolymers
[UCRL-84303] N80-32529

VIRUSES
The effect of designated pollutants on plant species
[AD-A078933] N80-32969

VISCOELASTICITY
Combustion: Structural interaction in a viscoelastic material N80-32761
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786

VISCOMETERS
Development of high temperature viscosity measurement technique
[SAND-80-0641] N80-32476

VISCOSITY
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176

VISCOUS FLOW
Computation of three-dimensional supersonic viscous flows in internal corners
[AD-A085857] N80-32345
Theoretical calculation of viscous-inviscid transonic flows
[AD-A087745] N80-32348

VISIBILITY
An analysis of foliage effects on long-range surveillance
[AD-A088163] N80-32643

VISUAL DISCRIMINATION
Automatic visual inspection of hybrid microcircuits
[BDX-613-2359] N80-32747

VISUAL PERCEPTION
Psychophysical criteria for visual simulation systems. Phase 2: Experimental investigations of display joints and scene inserts
[AD-A088316] N80-33091

VOICE COMMUNICATION
Voice communication research evaluation system
[AD-A088100] N80-32635

VOIDS
A void growth failure criterion applied to dynamically and statically loaded thin rings
[AD-A088515] N80-32781

VOLCANOES
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

VOLTAGE GENERATORS
Improved test methods for determining lightning-induced voltages in aircraft
[NASA-CR-3329] N80-32379

VOLTERRA EQUATIONS
PRANC: Program for analyzing nonlinear circuits
[AD-A088422] N80-32666

VOLUME
Reracking to increase spent fuel storage capacity, revision 1
[DOE/SR/SF-2004-REV-1] N80-33199

VORTEX BREAKDOWN
Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346

VORTEX RINGS
Concerning the separated flow about an inflating parachute
[RAE-TRANS-2031] N80-32336

VORTICES
A procedure for calculation of the pressure along the axis of a tip vortex
[AD-A087667] N80-32343
Vortex shedding from stationary and vibrating bluff bodies in a shear flow
[AD-A088083] N80-32346
Theoretical and experimental investigation of coherent structure in the turbulent boundary layer
[AD-A088248] N80-32696

VOYAGER PROJECT
Survey of the plasma electron environment of Jupiter: A view from Voyager
[NASA-TM-80731] N80-33325
Coordinates of features on the Galilean satellites
[NASA-CR-163582] N80-33326

W

WAFERS
Nondestructive evaluation of Si wafers using SAW
[AD-A084665] N80-33260

WALL FLOW
Selected data from a transonic flexible walled test section
[NASA-CR-159360] N80-32404
Psuedo-shock as a qualitative model in the investigation of the influence of wall roughness on the performance of supersonic MHD generators
[AD-A088333] N80-33228

WALL TEMPERATURE
Comparison of atmospheric temperature structure at the wall and in the middle of a valley
[LA-UR-80-792] N80-33071

WALLS
Performance of storage walls with highly conductive covering plates and connecting films
[SERI/TP-721-574] N80-32948
Computer modeling of thermal storage walls
[SERI/TP-721-610] N80-32949
Appraisal of the M factor and the role of building thermal mass in energy conservation
[ORNL/CON-46] N80-32958

WARFARE
The US Air Service in World War I. Volume 3: The Battle of Saint Mihiel
[AD-A088294] N80-32327

WARNING SYSTEMS
Operation of the PAVE PAWS radar system at Beale Air Force Base, California. Part 2. Public comment and Air Force response
[AD-A088321] N80-32645
Radiation intensity of the PAVE PAWS radar system
[AD-A088323] N80-32646

WASHINGTON
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

WASTE DISPOSAL
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987
Sampling and analysis of reduced and oxidized species in process streams
[PB80-191281] N80-32994
The occurrence and behavior of halomethanes in the aquatic environment
[PB80-190317] N80-32996
Sorption properties of sediments and energy-related pollutants
[PB80-189574] N80-32997
Reracking to increase spent fuel storage capacity, revision 1
[DOE/SR/SF-2004-REV-1] N80-33199
Nuclear waste management
[PNL-3000-4] N80-33203
Hydrogeologic effects of natural disruptive events on nuclear waste respositories
[PNL-2858] N80-33206

WASTE ENERGY UTILIZATION
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851

WASTE TREATMENT
Biological degradation of hydrazine
[AD-A084426] N80-32536
Meteorological and air quality data report. WIPP site: Eddy County, New Mexico
[SAND-79-7109] N80-32977
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

WASTE UTILIZATION
Synthetic fuels from municipal, industrial and agricultural wastes. Citations from the American Petroleum Institute data base
[PB80-812365] N80-32579
Seasonal thermal energy storage
[PNL-3322] N80-32899

WASTE WATER
Organic material emissions from holding ponds at coal-fired power generation facilities
[EPRI-EA-1377] N80-32987

WASTES
Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003

WATER COLOR
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions --- Lower Hudson River estuary; Maine; White Mountain National Forest, New Hampshire; Mt. St. Helens and Metsachee Creek, Washington; and the Santiaguito and Feugo volcanoes, Guatemala
[E80-10312] N80-32807

WATER CONSUMPTION
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815

WATER COOLED REACTORS
Centrifugal pump performance under simulated two-phase flow conditions
[CONF-800604-7] N80-32727

WATER EROSION
Manufacturing process development for dust and rain erosion resistant coated metallic clads for helicopter rotors
[AD-A088440] N80-32385

WATER FLOW
On the theory of flow of regular water wave about a body
[AD-A084359] N80-32693

WATER HEATING
Theory and design of an Annual Cycle Energy System (ACES) for residences
[ORNL/CON-43] N80-32904
Department of Housing and Urban Development solar hot water initiative: Centralized coordination of technical tasks and system evaluation
[PB80-189244] N80-32961

WATER MANAGEMENT
Irrigated lands assessment for water management Applications Pilot Test (APT) --- California
[E80-10324] N80-32815
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
Mapping model for determining land suitable for irrigation
[PB80-186683] N80-32843
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
Proceedings of National Conference on Urban Erosion and Sediment Control: Institutions and Technology
[PB80-197965] N80-33316

WATER POLLUTION
Biological degradation of hydrazine
[AD-A084426] N80-32536
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- South Dakota
[E80-10310] N80-32806
Satellite monitoring of sea surface pollution --- irish and north seas
[E80-10329] N80-32820
Performance tests of high speed ZRV oil skimmer
[AD-A088062] N80-32971
Performance evaluation of the aerated lagoon system at North Gulfort, Mississippi
[PB80-187461] N80-32985
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
The occurrence and behavior of halomethanes in the aquatic environment
[PB80-190317] N80-32996
Sorption properties of sediments and energy-related pollutants
[PB80-189574] N80-32997
Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075

WATER QUALITY
Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations
[PB80-192453] N80-32964
Performance evaluation of the aerated lagoon system at North Gulfort, Mississippi
[PB80-187461] N80-32985
Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003
User's manual for hydrological simulation program: FORTRAN (HSPF)
[PB80-191109] N80-33004

WATER RESOURCES
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
Preliminary estimate of regional effective ground-water recharge rates, related stream flow and water quality in Ohio
[PB80-193535] N80-32842
Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058

WATER TREATMENT
Multielement analysis of water through osmotic reduction and X-rays
[PB80-216690] N80-32482
Performance evaluation of the aerated lagoon system at North Gulfort, Mississippi
[PB80-187461] N80-32985

The occurrence and behavior of halomethanes in the aquatic environment
[PB80-190317] N80-32996
Phosphorous control strategies at municipal wastewater treatment plants in the US Great Lakes Basin
[PB80-191059] N80-32998
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
Advanced microbial check valve development
[NASA-CR-163577] N80-33094
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314

WATER VAPOR
Stress in porous thin films through adsorption of polar molecules
[AD-A087770] N80-32444

WATER WAVES
On the theory of flow of regular water wave about a body
[AD-A084359] N80-32693
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040
Solitons and the inverse scattering transform
[AD-A088023] N80-33141

WATERSHEDS
Application of remote sensing to selected problems within the state of california --- Mendocino, Colusa, and Shasta Counties
[E80-10326] N80-32817
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

WAVE EQUATIONS
Solitons and the inverse scattering transform
[AD-A088023] N80-33141

WAVE FRONT RECONSTRUCTION
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33036

WAVE INTERACTION
Coupled wave model for large magnet coils
[NASA-CR-3332] N80-32587
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040

WAVE PROPAGATION
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617
Elastic wave propagation through multilayered media
[AD-A088030] N80-32636
Numerical solution of a nonsteady blast wave propagation in two-phase (separated flow) reactive medium
[TAE-388] N80-32686
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33036

WAVE REFLECTION
Scattering matrix analysis of surface acoustic wave reflections and transducers
[AD-A085764] N80-33180

WAVE SCATTERING
Matrix theory of elastic wave scattering: Application to scattering of transverse waves
[UCRL-84116] N80-32649
Solitons and the inverse scattering transform
[AD-A088023] N80-33141

WAVEGUIDES
Opto-acoustic studies of methane impurities in argon
[AD-A088053] N80-32455
Support assembly for cryogenically coolable low-noise choke waveguide
[NASA-CASE-NPO-14253-1] N80-32605
Radiation from an open-ended waveguide with beam equalizer. A spectral domain analysis
[AD-A088179] N80-32642
Investigation of quasi-optical integrated circuits and electromagnetic scattering and radiation problems
[AD-A088075] N80-32669

WAVES
The mechanism of a detonation wave enhancement in a two-phase combustible medium
[TAE-393] N80-32687

WEAPONS DEVELOPMENT
Proceedings of the Particle Beam Research Workshop
[AD-A085158] N80-33196

WEAR TESTS
Wear and corrosion performance of metallurgical coatings in sodium
[HEDL-SA-1979] N80-32512

WEATHER
Revised Uniform Summary of Surface Weather Observations (RUSSWO) Monterey FAA, Monterey, California,, parts A, C-F
[AD-A087826] N80-33059
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Kingsley Field, Klamath Falls, Oregon. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063

WEATHER FORECASTING
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048
Workshop on Drought Forecasting for Northeast Brazil
[INPE-1750-RPE/143] N80-33053
Relation between west coastal rainfall and Nimbus-6 SCAMS liquid water data over the northeastern Pacific Ocean
[NASA-CR-160031] N80-33054
Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057
Quantitative precipitation forecasts
[INPE-1809-RPE/1977] N80-33058
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064

WEATHERING
Weathering tests on protective helmets approved to Australian standard AS 1698, for vehicle users
[AD-A084232] N80-32740

WEIBULL DENSITY FUNCTIONS
A time dependent error detection rate model for software performance assessment with applications
[AD-A088186] N80-33109

WEIGHT (MASS)
Beta gauge instrumentation for the measurement of aerosol mass
[PB80-195175] N80-32706

WEIGHTING FUNCTIONS
On the almost sure convergence of weighted sums of random elements in D[0, 1]
[AD-A088330] N80-33144
A robust confidence interval for samples of five observations
[AD-A088071] N80-33161

WEIGHTLESSNESS
The development of an elastic reverse gradient garment to be used as a countermeasure for cardiovascular deconditioning
[NASA-CR-152379] N80-33086

WELD TESTS
Weld overlaying for corrosion resistance in coal gasification atmospheres
[FE-2621-13] N80-32726
Weld evaluation on spherical pressure vessels using holographic interferometry
[UCRL-84079] N80-32745

WELDED STRUCTURES
Finite element analysis for the initiation of lamellar tearing in welded joints
[SAND-79-1891C] N80-32792
Materials studies for magnetic fusion energy applications at low temperatures, 3
[PB80-191497] N80-33209

WELDING
Improvement of reliability of welding by in-process sensing and control: Development of smart welding machines for girth welding of pipes
[DOE/ER-10474/1] N80-32724

WETTABILITY
A microdebonding test for in-situ fiber-matrix bond strength and moisture effects
[R80-1] N80-32437

WHEAT
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
An algorithm for estimating crop calendar shifts of spring small grains using LANDSAT spectral data
[E80-10314] N80-32809
Planning and execution of a photographic mission over a wheat producing region in Rio Grande do Sul, Brazil
[INPE-1793-RPE/165] N80-32833

WIDEBAND COMMUNICATION
Multiple band circularly polarized microstrip antenna
[NASA-CASE-MSC-18334-1] N80-32604

WIGGLER MAGNETS
Three dimensional calculation of electron energy loss in a variable parameter free-electron laser
[BNL-27598] N80-33195

WILDLIFE
Applied Remote Sensing Program (ARSP) --- Arizona
[E80-10330] N80-32821
The application of remote sensing to resource management and environmental quality programs in Kansas
[E80-10337] N80-32825

WINCHES
Dynamic technique for launching stratospheric balloons with experiments weighing more than 500 Kg aboard
[INPE-1821-RPE/187] N80-32340

WIND (METEOROLOGY)
Mesospheric winds from lidar observations of atmospheric sodium
[INPE-1811-RPE/179] N80-33051
McChord AFB, Washington. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan. Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061

WIND DIRECTION
Analytical studies of wind turbine turning characteristics
[RLO/2439-79/3] N80-32951
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048

WIND EFFECTS
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
User's manual for the vertical axis wind turbine performance computer code darter
[SAND-80-1155] N80-32872
Parabolic trough solar collector wind loading
[SAND-79-2134C] N80-32895

WIND MEASUREMENT
Weather and climate needs for Lidar observations from space and concepts for their realization --- wind, temperature, moisture, and pressure data needs
[NASA-TM-82006] N80-33057
Application of a photodiode-array optical turbulence sensor to wind studies in complex terrain
[UCRL-84503] N80-33074
Windfield retrieval from Doppler lidar observations
[NASA-CR-161572] N80-33123

WIND TUNNEL APPARATUS
Low-temperature solder for joining large cryogenic structures --- cooling cools for the National Transonic Facility
[NASA-TM-81836] N80-32490

WIND TUNNEL MODELS
Low speed aerodynamic characteristics of wings of aspect ratios 3 and 4 equipped with high lift systems
[AD-A087768] N80-32347
WIND TUNNEL TESTS
Pressure data for four analytically defined arrow wings in supersonic flow --- Langley Unitary Plan Wind Tunnel tests
[NASA-TM-81835] N80-32332
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90 --- conducted in Langley 6 by 28 inch transonic tunnel
[NASA-TP-1701] N80-32333
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft --- Ames 40- by 80-ft wind tunnel
[NASA-CR-152349] N80-32337
Use of nose cap and fuselage pressure orifices for determination of air data for space shuttle orbiter below supersonic speeds
[NASA-TP-1643] N80-32389
Investigation of performance, noise, and detectability characteristics of Remotely Piloted Vehicle (RPV) propellers
[AD-A088325] N80-32398
Selected data from a transonic flexible walled test section
[NASA-CR-159360] N80-32404
Wind tunnel investigation of the Titan Forward Skirt compartment vent from a free-stream Mach number of 0.80 to 1.96 --- conducted in the Lewis Research Center 8 by 6 foot supersonic wind tunnel
[NASA-TM-81572] N80-32689
Mean wind forces on parabolic-trough solar collectors
[SAND-80-7023] N80-32790
Line-focus solar central power system, phase 1. Subsystem experiment: Receiver heat transfer
[DOE/ET-20550/1] N80-32945
WIND VELOCITY
Analytical studies of wind turbine turning characteristics
[RLO/2439-79/3] N80-32951
The monsoon experiment MONEX
[NASA-CR-163509] N80-33048
Vertical velocity forced by topography in the Southern Hemisphere
[INPE-1691-RPE/119] N80-33052
WINDMILLS (WINDPOWERED MACHINES)
UTRC 8 kW wind turbine tests
[RFP-3085] N80-32722
WINDPOWER UTILIZATION
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98296-1] N80-32462
Investigation of the feasibility of using wind power for space heating in colder climates
[DOE/DP-03533/T3] N80-32950
Definition of gust model concept and review of gust models
[PNL-3138] N80-33072
Wind characteristics program element
[PNL-3211] N80-33073
WINDPOWERED GENERATORS
UTRC 8 kW wind turbine tests
[RFP-3085] N80-32722
Large wind turbines: A utility option for the generation of electricity
[NASA-TM-81502] N80-32858
Analytical studies of wind turbine turning characteristics
[RLO/2439-79/3] N80-32951
Development of an 8 kW wind turbine generator for residential type application. Phase 1: Design and analysis. Volume 1: Executive summary
[DOE/DP-03533/T1-VOL-1] N80-32957
Wind characteristics program element
[PNL-3211] N80-33073
WING TIPS
Development of high lift devices for application to advanced Navy aircraft
[AD-A084226] N80-32382
WING-FUSELAGE STORES
Computational and simplified analytical treatment of transonic wing-fuselage-pylon-store interactions
[AD-A085619] N80-32383
WINGS
Aerothermal analysis of a wing-elevon cove with variable leakage
[NASA-TP-1703] N80-32892
WIRE
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507
WISCONSIN
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
WOOD
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
Solar gasification of charcoal, wood and paper
[UCRL-84411] N80-32926

X

X RAY ANALYSIS
Multielement analysis of water through osmotic reduction and X-rays
[PB80-216690] N80-32482
X RAY DIFFRACTION
Methanol and methyl fuel catalyst
[FE-3177-5] N80-32472
X RAY SCATTERING
Interatomic forces in solid and liquid transition metals
[AD-A087672] N80-32492
X RAY SOURCES
Observations and analysis of X-ray binary stars under the IUE guest observer program
[NASA-CR-160035] N80-33320
X RAY SPECTRA
Spectroscopy of compact extragalactic X-ray sources --- HEAO observations
[NASA-TM-82010] N80-33332
X RAY STRESS ANALYSIS
A comparison of residual stress measuring techniques: Their strengths and weaknesses
[AD-A086409] N80-32779
XENON
Advanced concepts in closed-cycle lasers
[AD-A088226] N80-32712

Y

YIELD STRENGTH
High toughness-high strength iron alloy
[NASA-CASE-LEW-12542-3] N80-32484
YTTRIUM COMPOUNDS
Crystal growth by skull melting
[AD-A088013] N80-33269

Z

ZINC COMPOUNDS
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T12] N80-32875
Photoelectronic properties of zinc phosphide crystals, films and heterojunctions
[SU-DSE-4042-T10] N80-32876
Development of the zinc-chloride battery for utility applications
[EPRI-EM-1417] N80-32917
ZINC SELENIDES
Investigation of low-cost solar cells based on Cu2O
[DOE/ET-23006/3] N80-32915

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

A/S INTERNATIONAL SOLAR POWER CO. LTD., GENTOFTE (DENMARK).
Feasibility study on a solar house heating system with a low quality thermal flow
[EUR-6696-EN] N80-32939

AD-EX INTERNATIONAL, PORTOLA VALLEY, CALIF.
Quantitative gas analysis of sulfur dioxide in nitrogen by Fourier transform infrared spectrophotometer
[UCRL-TRANS-11554] N80-32468
Electromagnetic instabilities in collisionless plasmas
[UCRL-TRANS-11593] N80-33240

ADVANCED MECHANICAL TECHNOLOGY, INC., NEWTON, MASS.
Design and development of Stirling engines for stationary power generation applications in the 500 to 3000 horsepower range
[DOE/ET-15207/T1] N80-32723

ADVANCED RESEARCH AND APPLICATIONS CORP., SUNNYVALE, CALIF.
Automated X-ray orientation for quartz crystal resonators
[AD-A088063] N80-33272

AERODYNE RESEARCH, INC., BEDFORD, MASS.
Homogeneous production and removal of NO/subx/ from combustion exhaust gases
[ARI-RP-55] N80-32976

AERONAUTICAL RESEARCH ASSOCIATES OF PRINCETON, INC., N. J.
Resonant interactions of surface and internal gravity waves
[AD-A088324] N80-33040
Solitons and the inverse scattering transform
[AD-A088023] N80-33141
Viscous theory of surface noise interaction phenomena
[NASA-CR-3331] N80-33176

AERONAUTICAL RESEARCH LABS., MELBOURNE (AUSTRALIA).
Transonic pitch damping of a delta wing aircraft determined from flight measurements
[AD-A087771] N80-32381
A simplified digital filter design
[AD-A087772] N80-32658
Weathering tests on protective helmets approved to Australian standard AS 1698, for vehicle users
[AD-A084232] N80-32740
A minimum excursion-time control system
[AD-A087774] N80-33096

AEROSPACE CORP., EL SEGUNDO, CALIF.
Automating the E-beam laser
[AD-A079529] N80-32709

AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
Investigation of photographic image quality estimators
[AD-A087805] N80-32702
A technique for the injection of radioactive tracer microspheres during acceleration stress
[AD-A087931] N80-33087
USAF bioenvironmental noise data handbook. Volume 119: C-135B aircraft, near and far-field noise
[AD-A087953] N80-33184

AIR COMMAND AND STAFF COLL., MAXWELL AFB, ALA.
The free-body diagram revisited
[AD-A087952] N80-33173

AIR FORCE ACADEMY, COLO.
Predicted performance of energetic plasticizer formulations
[AD-A087658] N80-32542

AIR FORCE ENGINEERING AND SERVICES CENTER, TYNDALL AFB, FLA.
Biological degradation of hydrazine
[AD-A084426] N80-32536

AIR FORCE ENVIRONMENTAL TECHNICAL APPLICATIONS CENTER, SCOTT AFB, ILL.
Revised Uniform Summary of Surface Weather Observations (RUSSWO) Monterey FAA, Monterey, California,, parts A, C-F
[AD-A087826] N80-33059
McChord AFB, Washington: Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087812] N80-33060
Misawa AB, Japan: Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-E
[AD-A087824] N80-33061
Loring AFB, Caribou, Maine: Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087823] N80-33062
Kingsley Field, Klamath Falls, Oregon: Revised Uniform Summary of Surface Weather Observations (RUSSWO), parts A-F
[AD-A087825] N80-33063

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Ion production in the D-region
[AD-A085533] N80-33038
Atmospheric transmittance/radiance: Computer code LOWTRAN 5
[AD-A088215] N80-33042
Development of techniques to specify cloudiness and rainfall rate using GOES imagery data
[AD-A084757] N80-33064
Atlas of cloud-free line-of-sight probabilities. Part 5: North Africa and the Middle East
[AD-A088156] N80-33069
Two papers on the methods of evaluating the quality of solar proton event forecasting from the People's Republic of China
[AD-A088154] N80-33328

AIR FORCE GLOBAL WEATHER CENTRAL, OFFUTT AFB, NEBRASKA.
Geomagnetic index calculation and use at AFGWC
[AD-A088234] N80-33043

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Cooperative estimation of targets by multiple aircraft
[AD-A085799] N80-32366
The analysis and design of constrained layer damping treatments
[AD-A088200] N80-32786

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Elastic wave propagation through multilayered media
[AD-A088030] N80-32636

AIR FORCE MEDICAL CENTER, WRIGHT-PATTERSON AFB, OHIO.
Voice communication research evaluation system
[AD-A088100] N80-32635
Hearing protection and speech communication characteristics of selected USAF inflight helmets
[AD-A088099] N80-33101

AIR FORCE OFFICE OF SCIENTIFIC RESEARCH, BOLLING AFB, WASHINGTON, D.C.
Proceedings of the Particle Beam Research Workshop
[AD-A085158] N80-33196

AIR FORCE WEAPONS LAB., KIRTLAND AFB, N. MEX.
Radiation evaluation study of LSI RAM technologies
[AD-A084168] N80-32660

AIR FORCE WRIGHT AERONAUTICAL LABS., WRIGHT-PATTERSON AFB, OHIO.
Service test of two fuel conductivity additives
[AD-A088046] N80-32540

AKRON UNIV., OHIO.
Combustion: Structural interaction in a viscoelastic material N80-32761
Self-adaptive incremental Newton-Raphson algorithms N80-32764

ALBERT F. SIMPSON HISTORICAL RESEARCH CENTER, MAXWELL AFB, ALA.
The US Air Service in World War I. Volume 3: The Battle of Saint Mihiel
[AD-A088294] N80-32327

AMERICAN LIQUID XTAL CHEMICAL CORP., KENT, OHIO.
New instrumentation for temperature measurement. Phase 1: Program solicitation, small business innovation research
[PB80-184682] N80-32705

AMERICAN NATIONAL STANDARDS INST., NEW YORK.
Symposium on International Standards Information and ISONET
[PB80-197221] N80-33304

AMERICAN WIND ENERGY ASSOCIATION, WASHINGTON, D.C.
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462

AMES LAB., IOWA.
AC losses in type-2 superconductors
[IS-M-280] N80-32679
A-15 superconducting composites in the 0.1 micron region
[IS-M-274] N80-33274

AMEX SYSTEMS, INC., HAWTHORNE, CALIF.
Mini arc welding/brazing technique
[PB80-186497] N80-32739

AMPEX CORP., REDWOOD CITY, CALIF.
Recording media archival attributes (magnetic)
[AD-A088187] N80-32704

SOURCE

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
Low-cost flywheel demonstration program
[DOE/ET-26931/T1] N80-32897
Efficient algorithms for solving systems of ordinary differential equations for ecosystem modeling
[PB80-190986] N80-33002
Multi-year slant path rain fade statistics at 28.56 and 19.04 GHz for Wallops Island, Virginia
[NASA-CR-160027] N80-33056

APPLIED PSYCHOLOGICAL SERVICES, WAYNE, PA.
Human performance in continuous operations. Volume 3: Technical documentation
[AD-A088339] N80-33092

ARATEX SERVICES, INC., ENCINO, CALIF.
Solar hot water demonstration project at Red Star Industrial Laundry, Fresno, California
[NASA-CR-161537] N80-32851

ARCO SOLAR, INC., CHATSWORTH, CALIF.
Design and fabrication of combined photovoltaic-thermal collectors
[SAND-79-7008] N80-32890

ARCTEC, INC., COLUMBIA, MD.
Saint Lawrence River all-year navigation ice control system
[PB80-183478] N80-32841

ARGONNE NATIONAL LAB., ILL.
Pulse combustion technology for heating applications
[ANL/EES/TM-85] N80-32467
Corrosion behavior of several metals in ethylene glycol-base heat-transfer fluids under conditions encountered in solar energy systems
[ANL-79-96] N80-32508
Alcohol production from agricultural and forestry residues
[ANL/EES/TM-88] N80-32544
Assessment of Peruvian biofuel resources and alternatives
[ANL/EES/TM-86] N80-32547
Role of Al substitution on hydrogen diffusion in beta-LaNi5Al/sub y/H/sub x
[MLM-2733(OP)] N80-32549
Biaxial creep-fatigue behavior of materials for solar thermal systems
[ANL-80-34] N80-32802
Satellite Power Systems (SPS) cost review
[DOE/TIC-11190] N80-32928
Fusion reactor blanket/shield design study
[ANL/FPP-79-1] N80-33242

ARIZONA STATE UNIV., TEMPE.
Development of an effectiveness planning and evaluation model for Air Force Maintenance Organizations
[AD-A088061] N80-32326

ARIZONA UNIV., TUCSON.
Applied Remote Sensing Program (ARSP)
[E80-10330] N80-32821
Hydrogeologic effects of natural disruptive events on nuclear waste respositories
[PNL-2858] N80-33206

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.
Sensitivity of some explosive/brine mixtures
[AD-A087939] N80-32534
A comparison of residual stress measuring techniques: Their strengths and weaknesses
[AD-A088409] N80-32779

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.
The austenitizing behavior of a low alloy steel
[AD-A088540] N80-32497
Electrodeposition of tantalum and tantalum-chromium alloys
[AD-A088542] N80-32498
A photoelastoplastic study of stress concentration factors and residual stresses in two notched specimens of polycarbonate material
[AD-A088538] N80-32787

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, ST. LOUIS, MO.
Aerodynamic characteristics of three helicopter rotor airfoil sections at Reynolds number from model scale to full scale at Mach numbers from 0.35 to 0.90
[NASA-TP-1701] N80-32333

ARMY COLD REGIONS RESEARCH AND ENGINEERING LAB., HANOVER, N. H.
Mathematical model to correlate frost heave of pavements with laboratory
[AD-A084737] N80-32590
Mathematical model to correlate frost heave of pavements with laboratory predictions
[AD-A084093] N80-32594

ARMY CONSTRUCTION ENGINEERING RESEARCH LAB., CHAMPAIGN, ILL.
Identification and quantification of hydrocarbon products in effluents
[AD-A088268] N80-32454

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, FORT MONMOUTH, N. J.
Acceleration sensitivity compensation of crystal resonators
[AD-A085683] N80-32662
Electroluminescent display technology
[AD-A085641] N80-32663

ARMY ELECTRONICS TECHNOLOGY AND DEVICES LAB., FORT MONMOUTH, N. J.
Design, fabrication and evaluation of low cost diode oscillator for millimeter waves
[AD-A087954] N80-32667
The effect of vibration on quartz crystal resonators
[AD-A085642] N80-32677

ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.
Interpretation of data from uphole refraction surveys
[AD-A087775] N80-33036

ARMY MATERIALS AND MECHANICS RESEARCH CENTER, WATERTOWN, MASS.
Scattered light photoelastic analysis of a projectile bulkhead to structural case joint
[AD-A079563] N80-32748

ARMY MATERIEL DEVELOPMENT AND READINESS COMMAND, ALEXANDRIA, VA.
A computer program to analyze spread-spectrum system performance
[AD-A084179] N80-32624

ARMY MILITARY PERSONNEL CENTER, ALEXANDRIA, VA.
Application of image intensifier technology to the military, scientific, industrial, educational, and medical communities
[AD-A088165] N80-32676

ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
Flaw detection and evaluation of composite cylinders using laser speckle interferometry and holography
[AD-A088206] N80-32447

ARMY MISSILE RESEARCH AND DEVELOPMENT COMMAND, REDSTONE ARSENAL, ALA.
Proceedings of the Workshop on Millimeter and Submillimeter Atmospheric Propagation Applicable to Radar and Missile Systems
[AD-A087754] N80-32617

ARMY RESEARCH INST. FOR THE BEHAVIORAL AND SOCIAL SCIENCES, ALEXANDRIA, VA.
Helicopter electro-optical system display requirements. 3: The effects of CRT display size and luminance on dark adaptation of helicopter pilots
[AD-A088527] N80-32391

ARO, INC., ARNOLD AIR FORCE STATION, TENN.
Infrared optical properties of thin CO, NO, CH4, HC1, N2O, O2, AR, and air cryofilms
[AD-A088269] N80-33214
Heat transfer and static stability tests of the General Purpose Heat Source (GPHS) configurations at Mach 8.0
[AD-A088031] N80-33287

ASSOCIATION OF BAY AREA GOVERNMENTS, BERKELEY, CALIF.
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009

AUBURN UNIV., ALA.
Seasonal thermal energy storage
[PNL-3322] N80-32899
Operator manual: High temperature heat pump
[DOE/CS-40163/T1] N80-32902

AUTOMATION INDUSTRIES, INC., SILVER SPRING, MD.
Environmental data for sites in the National Solar data network
[SOLAR/0010-80/05] N80-32986

AUTOMOTIVE ENVIRONMENTAL SYSTEMS, INC., WESTMINSTER, CALIF.
A study of exhaust emissions from 1978-1980 model year three-way catalyst vehicles in Los Angeles
[PB80-187453] N80-33013

AVCO-EVERETT RESEARCH LAB., MASS.
Rare gas halide lasers for fusion N80-32713
Open-cycle MHD power conditioning and control requirements definition
[EPRI-AP-1345] N80-32864
Engineering test facility conceptual design
[DOE/FE-2614/3] N80-32943

B

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Ignition of NOS 365 liquid propellant containing an air bubble under simulated vreech pressurization conditions
[AD-A085723] N80-32538
Shear strains, strain rates and temperature changes in adiabatic shear bands
[AD-A087765] N80-32778

BARBER-NICHOLS ENGINEERING CO., ARVADA, COLO.
Solar powered rankine cycle irrigation pump
[DOE/ET-20419/1] N80-32892

BATTELLE COLUMBUS LABS., MOUNTAIN VIEW, CALIF.
NASA aviation safety reporting system
[NASA-TM-81197] N80-32352

BATTELLE COLUMBUS LABS., OHIO.
Evaluation of safety programs with respect to the causes of general aviation accidents: Volume 1: Technical report
[AD-A087685] N80-32355
Post-buckling behavior of a beam-column on a nonlinear elastic foundation with a gap N80-32767

BATTELLE NORTWEST LABS., RICHLAND, WASH.
Seasonal thermal energy storage
[PNL-3322] N80-32899

BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
Development of ultrasonic tomography for residual stress mapping
[EPRI-NP-1407] N80-32798
Porous media experience applicable to field evaluation for compressed air energy storage
[PNL-3294] N80-32873
Definition of gust model concept and review of gust models
[PNL-3138] N80-33072
Wind characteristics program element
[PNL-3211] N80-33073
Nuclear waste management
[PNL-3000-4] N80-33203

BAY AREA AIR QUALITY MANAGEMENT DISTRICT, SAN FRANCISCO, CALIF.
Application of photochemical models. Volume 1: The use of photochemical models in urban ozone studies
[PB80-192495] N80-33009

BDM CORP., MCLEAN, VA.
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 2: Technical results
[SAND-79-7018/2-VOL-2] N80-32870
Photovoltaic applications definition and photovoltaic system definition study in the agricultural sector. Volume 3. Appendixes
[SAND-79-7018/3] N80-32891

BECHTEL NATIONAL, INC., SAN FRANCISCO, CALIF.
Combined cycle solar central receiver hybrid power system study. Volume 1: Executive summary
[DOE-ET-21050/1-1] N80-32867
Combined cycle solar central receiver hybrid power system study, volume 2
[DOE-ET-21050-1-2] N80-32868
Combined cycle solar central receiver hybrid power system study. Volume 3: Appendices

BELL TELEPHONE LABS., INC., HOLMDEL, N. J.
The influence curve and goodness of fit
[AD-A085593] N80-33152

BENDIX CORP., KANSAS CITY, MO.
Metrology data reduction system: PDP-11/34 computer system
[BDX-613-2402] N80-32599
Power ratings of rf thin film resistive attenuators
[BDX-613-2404] N80-32683
Automatic visual inspection of hybrid microcircuits
[BDX-613-2359] N80-32747
Plated-through hole testing
[BDX-613-2424] N80-32800
Finite element stress analysis of a compression mold
[BDX-613-2387] N80-32801
BIHRLE APPLIED RESEARCH, INC., JERICHO, N. Y.
Rotary balance data for a typical single-engine general aviation design for an angle-of-attack range of 8 deg to 90 deg. 2: High-wing model C
[NASA-CR-3201] N80-32335
BJORKSTEN RESEARCH LABS., INC., MADISON, WIS.
Alternative highway deicing chemicals, executive summary
[PB80-193634] N80-32601
BOEING AEROSPACE CO., SEATTLE, WASH.
Laser angle measurement system
[NASA-CR-159306] N80-32405
Psychophysical criteria for visual simulation systems. Phase 2: Experimental investigations of display joints and scene inserts
[AD-A088316] N80-33091
BOEING COMMERCIAL AIRPLANE CO., SEATTLE, WASH.
Large scale wind tunnel investigation for future modifications to the quiet short-haul research aircraft
[NASA-CR-152349] N80-32337
BOEING VERTOL CO., PHILADELPHIA, PA.
Design and analysis of CH-47 external cargo handling system (snubbed load)
[AD-A088057] N80-32984
BOLT, BERANEK, AND NEWMAN, INC., CAMBRIDGE, MASS.
PROCRU: A model for analyzing crew procedures in approach to landing
[NASA-CR-152397] N80-33090
BOLT, BERANEK, AND NEWMAN, INC., CANOGA PARK, CALIF.
Development of noisecheck technology for measuring aircraft noise exposure
[AD-A088033] N80-33182
Study of lateral excess sound attenuation as determined from far part 36 aircraft noise certification measurements
[AD-A088285] N80-33183
Computer program to add noisemap grids of different spacings
[AD-A088205] N80-33185
BOSTON COLL., CHESTNUT HILL, MASS.
A tentative taxonomy of human interactive factors in aircraft mishaps
[AD-A088442] N80-33099
BRAUN (C. F.) AND CO., ALHAMBRA, CALIF.
Assessment of sulfur removal processes for advanced fuel cell systems
[EPRI-EM-1333] N80-32866
BRAZILIAN INST. FOR FORESTRY DEVELOPMENT, SAO JOSE DOS CAMPOS.
The use of LANDSAT data for evaluation and characterization of deforested pastureland and reforested areas in Brazil
[INPE-1794-RPE/166] N80-32836
BRITISH CARBONIZATION RESEARCH ASSOCIATION, CHESTERFIELD (ENGLAND).
Investigation into the use of hydrogen peroxide for the purification of carbonization wastes
[BCRA-67] N80-33314
BRITISH LIBRARY LENDING DIV., BOSTON SPA (ENGLAND).
Transmission of 565 Mbit/s signals via coaxial cables
[BLL-RDL-TRANS-3793-(7737.470)] N80-32606
BROBECK (WILLIAM M.) AND ASSOCIATES, BERKELEY, CALIF.
Fabrication of two one-fifth scale fiber composite flywheels
[UCRL-15231] N80-32910
BROOKHAVEN NATIONAL LAB., UPTON, N. Y.
Application of analytical electron microscopy to the study of intergranular corrosion in 304 stainless steel
[BNL-27344] N80-32506
Flux pinning in bronze-processed Nb3Sn wires
[BNL-27964] N80-32507
Hydrogen production from remote power sites
[BNL-27457] N80-32553
Fusion reactors for hydrogen production via electrolysis
[BNL-27782] N80-32559
Advanced snyfuels production/power systems utilizing laser particulate control
[BNL-27783] N80-32570
Soot reduction in diesel engines by catalytic effects
[BNL-27792] N80-32731
Bending behavior of lapped plastic EHV cables
[BNL-27331] N80-32789
Reference energy systems as applied to regional energy policy
[BNL-26987] N80-32883
Costing methodologies for energy systems
[BNL-27603] N80-32900
Simulation model for assessing building energy-conservation policies
[BNL-27802] N80-32901
Environmental control technology for carbon dioxide
[DOE/EV-0079] N80-32972
Sensitivity of the eastern United States to acid precipitation impacts on surface waters
[BNL-27851] N80-32980
More on approximations of Poisson probabilities
[BNL-27878] N80-33164
Three dimensional calculation of electron energy loss in a variable parameter free-electron laser
[BNL-27598] N80-33195
Fusion: An energy source for synthetic fuels
[BNL-27891] N80-33205
Light induced electron transfer reactions of metal complexes
[BNL-28043] N80-33277
Effects of irradiation and mechanical stress on the superconducting properties of candidate magnet conductors
[BNL-27976] N80-33278
BROWN UNIV., PROVIDENCE, R. I.
Effect of processing parameters on reaction bonding of silicon nitride
[NASA-CR-163579] N80-32441
Approximation schemes for the linear-quadratic optimal control problem associated with delay equations
[AD-A088245] N80-33121
The Riccati integral equation arising in optimal control of delay differential equations

Sediment bacteria as a water quality indicator in the Lynnhaven estuary
[PB80-192354] N80-33003

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
Engineering properties of multiphase block copolymers
[AD-A088327] N80-32524
CdSiAs2 thin films for solar cell applications
[DOE/ET-23007/1] N80-32919

VIRGINIA UNIV., CHARLOTTESVILLE.
Active feedback control for stabilization of vibration in rotating machinery (24.034)
[DOE/ET-13151/T5] N80-32725
Sulfur dioxide oxidation in scrubber systems
[PB80-187842] N80-33000

VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE (BELGIUM).
Hypersonic wind tunnel study of a 15 deg - 30 deg half angle concave biconic model up to high angles of attack
[AD-A088129] N80-32349

VONIER (THOMAS) ASSOCIATES, INC., WASHINGTON, D.C.
Capital formation for small wind energy conversion system manufacturers: A guide to methods and sources
[SERI/TR-98298-1] N80-32462

VOUGHT CORP., DALLAS, TEX.
Environmental protection requirements for scout/shuttle auxiliary stages
[NASA-CR-3328] N80-32416

W

WASHINGTON UNIV., SEATTLE.
Error propagation and optimal performance in multicomponent analysis
[AD-A088207] N80-32460
A void growth failure criterion applied to dynamically and statically loaded thin rings
[AD-A088515] N80-32781
Dynamic mixed mode fracture
[AD-A088287] N80-32784
How many steps?
[AD-A087860] N80-33107
The diameter of almost all bipartite graphs
[AD-A087687] N80-33125
Qualitative matrices: Strong sign-solvability and weak satisfiability
[AD-A087686] N80-33168
Technique for measuring parity nonconservation in hydrogenic atoms
[DOE/ER-01388-444] N80-33193

WATKINS-JOHNSON CO., PALO ALTO, CALIF.
Design, fabricate and test an Electron Bombarded Semiconductor (EBS) amplifier
[NASA-CR-160002] N80-32656

WAYNE STATE UNIV., DETROIT, MICH.
Cuprous oxide photovoltaic cells
[DOE/ET-23010/17] N80-32932
Basic Research in Engineering: Process and Systems Dynamics and Control. High Priority Research Needs Relevant to Energy
[FE-2468-65] N80-33167

WEAPONS RESEARCH ESTABLISHMENT, ADELAIDE (AUSTRALIA).
Improvements to the NSWC aerodynamics prediction program of particular significance for bombs
[AD-A087769] N80-32344

WEAPONS SYSTEMS RESEARCH LAB., ADELAIDE (AUSTRALIA).
An iterative approach to the deconvolution of the narrowband outputs of a conventional beamformer
[AD-A088276] N80-32632

WEBB ASSOCIATES, YELLOW SPRINGS, OHIO.
The development of an elastic reverse gradient garment to be used as a countermeasure for cardiovascular deconditioning
[NASA-CR-152379] N80-33086

WESTINGHOUSE DEFENSE AND ELECTRONIC SYSTEMS CENTER, BALTIMORE, MD.
Low sidelobe S-band line source array
[AD-A087651] N80-32616

WESTINGHOUSE ELECTRIC CORP., MADISON, PA.
Advanced coal gasification system for electric power generation
[FE-1514-113] N80-32557

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Collector sealants and breathing
[DOE/CS-15362/1] N80-32527
Open-cycle MHD systems analysis
[EPRI-AP-1316] N80-32881

WESTINGHOUSE ELECTRIC CORP., SHARON, PA.
Characteristics of insulating oil for electrical application
[EPRI-EL-1300] N80-32681

WESTINGHOUSE RESEARCH AND DEVELOPMENT CENTER, PITTSBURGH, PA.
Development of copper sulfide/cadmium sulfide thin film solar cells
[DSE-4642-T42] N80-32931

WISCONSIN UNIV. - MADISON.
Luminescent tellurium-doped cadmium sulfide electrodes as probes of semiconductor excited-state deactivation processes in photoelectrochemical cells
[AD-A088532] N80-32451
Availability of pollutants associated with suspended or settled river sediments which gain access to the Great Lakes
[PB80-189566] N80-32993
Performance evaluation of existing aerated lagoon system at consolidated Koshkonong sanitary district, Edgerton, Edgerton, Wisconsin
[PB80-189681] N80-33015
Tandem mirror reactors with thermal barriers
[UCRL-83505] N80-33244

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Remote acoustic sensing of oceanic fluid and biological processes
[AD-A087665] N80-33075
WORCESTER POLYTECHNIC INST., MASS.
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-10] N80-32556
WYOMING UNIV., LARAMIE.
New method to determine the independent shear moduli of transversely isotropic materials
[CONF-800575-1] N80-32796

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.
